TenTec may be just as frustrated as their users about the RIT problem. I can't think of any reason they wouldn't want to find the reason for the problem. I've had my Orion since 2004 and have never had the problem. Will I have it the next time I turn on the radio? Who knows? Maybe the encoder came from a plant that also supplies things for Toyota. If that's the case then you just need to sit your radio on a different floor mat.

Subject: RE: [orion565] Re: Orion RIT encoder

I had an interesting exchange with Jack Burchfield on the RIT issue this week. He is always a gentleman, but this time was a little more brusque and brief than usual. He told me he knew I thought TenTec should have identified the source of the problem but that they still had not observed it at the factory. I had said that at least with each of the Orions I have owned the problem would show have shown up with very minimal use. Jack replied that he owned a 565, probably doesn't use it as much as I do, and rarely uses RIT but has never seen a problem when he does. To me that was not very relevant. He did arrange for a tech to be waiting for my call. I pressed him on whether the problem would be fixed or if I would experience it again. He replied that permanently fixed is a long long time. I replied that no recurrence in 7 years was permanent enough, recurrence in one year was not. No further communication after that. I don't have a lot of enthusiasm for going through the "no trouble found" cycle since they are still shooting in the dark. Sometimes doing the "press on the panel between the sweep and display" fixes my problem temporarily. At other times that does not work and it is a "pull on the RIT" situation. It seems that just about anything you do-such as dropping the panel, resoldering this or that-mechanically disturbs things enough to temporarily cure the problem. Vibration during shipment back to TenTec is apparently a 100% temporary cure based on factory data. Very frustrating. I suspect this has not been good for TenTec's reputation.

These exchanges are frustrating, but understandable. You have to believe TT if they say they haven't seen the problem. But they have to believe us when we (many of us) say that we have. If they can't produce the problem on their bench, you can't expect them to guarantee that they can fix it.

Everything I've read and experienced myself is *consistent* with the view that the J8 board-to-board connector is somewhat unreliable. A little dirt, oxidation, or misalignment over time is enough to make the RIT encoder connection drop out. Warping the boards a little (by various means) will generally bring it back.

I haven't checked the circuit, but probably this is a "dry" contact (low current) that a very slight insulating barrier can interrupt. Loading the circuit with a constant few mA of current or using deoxit might help. But the real solution, if the theory is correct, would be to use a more positive connector system -- not an easy change to make.

[A fun project would be to install a cell phone vibrator on the CPU board, so you could give it a buzz when RIT hangs up.]

My 2c worth.

5951. Re: Orion RIT encoder

Yahoo group: orion565 (2009 — 2013)
Date: 2010-02-28 14:27:25 UTC
From: Anthony
Topic: 5935 Message: 5951

I posted a lengthy message a while back with some details about replacing these encoders. My observation of the encoders and mounting method leads me to believe that not only the RIT but any of these controls could become unstable, depending on several factors:

1. These are mechanical encoders and seem a bit "delicate' to me.

2. They are made for Ten-Tec to their spec (according to Paul Clinton). One thing that strikes me about them is the extra long shaft (and very small body). Like most potentiometers, only a single support holds this shaft (and its wiper mechanism). While this isn't a potentiometer, it behaves much like one; except in this case the wiper slides along multiple contacts rather than a carbon or wire trace.

3. There are long plastic/nylon tubes that go over these shafts and are secured to the board with thread nuts (same material).

4. With a long shaft, any slight skew at the encoder mounting point, will be more pronounced at points along the shaft further removed from the mount.

5. If you look at pictures of encoders that have been removed (I don't have the link handy, but there is a series of pics that describe the RIT encoder replacement), you will note that some of the shafts have marks on them (almost like they had been polished. I suspect this is from the shaft rubbing against the inside of the tube).

6. What I postulate is that one or more of the encoders were mounted and soldered with a slight skew (not sure what type of fixture they used, if any, but I can see where this could happen very easily). Since most of the reported issues have been with the RIT encoder, I suspect the board was stuffed, then soldered along a small assembly line, and the board orientation was such that the RIT encoder was more likely to be slightly misaligned.

7. Added stress off-center (due to skewed mounting and an extra long shaft) would tend to shorten the life of this control (making it erratic, have dead spots, or just stop working).

8. Since this electrically erratic condition was caused by erratic mechanical action, pushing here, tightening there or heating a connection could settle it down for a little while. But since the real cause isn't addressed, and some internal structural damage has occurred to the encoder, these 'fixes' would only be temporary.

9. The only fix that will last (if what I believe to have caused it in the first place is correct) would be to replace the encoder. However the mounting technique and replacement part will still be the same, so you run the risk of the problem popping up again.

This is only my opinion, so please take it as such.

Hopefully Yahoo hasn't destroyed the format of this post.

I had similar thoughts about possibly needing to change encoders, but fiddling with J8 "cured" the problem for me. And it's possible that disassembling the boards, replacing the encoders, and reassembling everything would also have tweaked the J8 contacts enough to "cure" the problem. On the other hand, my tweaks of J8 might have accidentally done something to bring the encoder back to normal...

With this kind of intermittent, it's really hard to pin down the root cause -- assuming there is only one cause.

Although I have never experienced this issue in the O2, this is a well known problem in the FT 1000 series of radios. If indeed this problem is directly attributed to a faulty encoder, it may be possible to rework the encoder while it is still installed in the radio, thus saving much time and expense. In the FT 1000 MP Mark V, the lubricant within the clarifier encoder causes intermittency and the clarifier will cause frequency jumps. Removing the shaft knob, and gently attaching the chuck of a small battery operated drill to the encoder shaft, will permit higher speed operation of the encoder than can be obtained by hand. Rotate the shaft for about 30 seconds clockwise at a moderate rate, then repeat this process counterclockwise. One more cycle should be enough to improve encoder operation. Use a light touch and be careful of the alignment of the chuck and encoder shaft. In the Yaesu radios, this procedure can save quite a bit of repair time. If you are not familiar with transceiver repairs, this technique may not be for you. It has worked for many Yaesu owners, please be careful. 73 and Happy DXing, Mike W2AJI

Hmm, didn't the whole RIT encoder problem turn out to be an issue of the connectors at the end of the cables running to the encoders? You might want to check the history on the forum because we went through a long time of folks swapping out encoders only to have them fail again in the future, and then the (if I remember correctly) connectors on the encoder cable ends turned out to be the issue after all.

Like most potentiometers, only a single support holds this shaft (and its wiper mechanism). While this isn't a potentiometer, it behaves much like one; except in this case the wiper slides along multiple contacts rather than a carbon or wire trace.

3. There are long plastic/nylon tubes that go over these shafts and are secured to the board with thread nuts (same material).

4. With a long shaft, any slight skew at the encoder mounting point, will be more pronounced at points along the shaft further removed from the mount.

5. If you look at pictures of encoders that have been removed (I don't have the link handy, but there is a series of pics that describe the RIT encoder replacement), you will note that some of the shafts have marks on them (almost like they had been polished. I suspect this is from the shaft rubbing against the inside of the tube).

6. What I postulate is that one or more of the encoders were mounted and soldered with a slight skew (not sure what type of fixture they used, if any, but I can see where this could happen very easily). Since most of the reported issues have been with the RIT encoder, I suspect the board was stuffed, then soldered along a small assembly line, and the board orientation was such that the RIT encoder was more likely to be slightly misaligned.

7. Added stress off-center (due to skewed mounting and an extra long shaft) would tend to shorten the life of this control (making it erratic, have dead spots, or just stop working).

8. Since this electrically erratic condition was caused by erratic mechanical action, pushing here, tightening there or heating a connection could settle it down for a little while. But since the real cause isn't addressed, and some internal structural damage has occurred to the encoder, these 'fixes' would only be temporary.

9. The only fix that will last (if what I believe to have caused it in the first place is correct) would be to replace the encoder. However the mounting technique and replacement part will still be the same, so you run the risk of the problem popping up again.

This is only my opinion, so please take it as such.

Hopefully Yahoo hasn't destroyed the format of this post.

5955. New file uploaded to orion565

Yahoo group: orion565 (2009 — 2013)
Date: 2010-03-07 07:53:45 UTC
From: orion565@yahoogroups.com
Topic: 222 Message: 5955

Hello,

This email message is a notification to let you know that
a file has been uploaded to the Files area of the orion565
group.

File : /pa1ap AGC program/orion_agc_macro_v2 20134.zip
Uploaded by : pa1ap <pa1ap@...>
Description : Orion Macro V2 20134; new features included; option to make slider window smaller, antenna selector bug fix, audio presence charts, 10 profile sets instead of 5, option to change startup behavior of program, compressed manual (?) inside program, queue progress bar in prog, rewrite profile file within prog. Enjoy and 73 pa1ap

You can access this file at the URL:
http://groups.yahoo.com/group/orion565/files/pa1ap%20AGC%20program/orion_agc_macro_v2%20134.zip

To learn more about file sharing for your group, please visit:
http://help.yahoo.com/l/us/yahoo/groups/original/members/forms/general.htmlfiles

Regards,

pa1ap <pa1ap@...>

5956. Re: New file uploaded to orion565

And a new youtube 4 minute video to demo the results of the program. It is available in 480 & 720 HD resolution too.

http://www.youtube.com/watch?v=dWCsUtUdD8U

Enjoy, 73 pa1ap

Where can the graphs be seen that are displayed at 2:00 in the video?

Tnx/73,

Start the program and in the menu bar you will find a button on the right for Chart... When the chart window appears it will plot the profile settings for threshold and rf gain. When you change the profile from one set to another you will see the plot following the change. When you push one of the S meter buttons in the main slider window, you will see the audio presence plotted. From what I have measured signals below threshold will not be processed by agc. If threshold is x dB above band noise, band noise presence will be x dB lower audio presence.

If you like to build your own profiles and or change the the startup behavior of the program you can also look at the 5 minute video below.

http://www.youtube.com/watch?v=PlpE9nH9qgE

Its fun to play with it an experiment with the settings.

Cheers, Onno pa1ap

5960. Orion sidetone distortion

Yahoo group: orion565 (2009 — 2013)
Date: 2010-03-12 21:36:24 UTC
From: john@k5see.com
Topic: 5960 Message: 5960

An unusual problem has developed on my Orion. The sidetone begins to distorrt after a minute or two of sending after turn on. It gets worse until it is like a static crash. The ear phone sidetone is not distorted when this happens. The receive audio is normal. What gives? Any ideas?

Master Reset done but no help. Paul Clinton responded quickly and
advises a RAM Reset followed by Master Reset, so I will give it a try
and report on the results.

I found the speaker connector to have a weak connection, resulting in a similar audio break down at times. Simple to test; wiggle the plug a little to see if the audio shows any signs of distortion. Cheers, Onno pa1ap

The RAM clear/master reset sequence had no effect. It seems to be some kind of RF feedback internal to the Orion, since higher power makes it worse.. It is not present at turn on, but gets worse as the radio warms up. A loose connection somehere in the speaker audio output chain is a real posssibility. Wil check it out and revert. Thanks.

Hello,

This email message is a notification to let you know that
a file has been uploaded to the Files area of the orion565
group.

File : /pa1ap AGC program/orion_agc_macro_v2 20135.zip
Uploaded by : pa1ap <pa1ap@...>
Description : Patch update 20135. Changes included: audio presence slope adjustment through window as well agc_profile variable. "bug" repaired in slider zoom function. Cosmetic bug fixed on AGC buttons window; threshold and rf gain now include the true values as found in agc_profile. As well attn buttons are available at first startup. AGC window size (minimal and maximum) can now be adjusted by user through agc_profile file. Please rewrite agc_profile_3.txt file (or delete prior to start).

You can access this file at the URL:
http://groups.yahoo.com/group/orion565/files/pa1ap%20AGC%20program/orion_agc_macro_v2%20135.zip

5966. Re: New file uploaded to orion565 V20135

Yahoo group: orion565 (2009 — 2013)
Date: 2010-03-13 16:21:34 UTC
From: pa1ap
Topic: 222 Message: 5966

Greetings,

To activate all program startup variables, please rewrite the agc_profile_3.txt file through "prog" button. Or delete the file and (re)start the program after installation.

Window size is now adjustable. Both for normal size (702 x 245) and minimal size (552 x 190).

There are new Orion 2 profiles included, the profiles with an astrix (*) are tested using RF generator, FFT audio analysis and should provide best results.

Based on feedback on audio presence I have include adjustable audio presence slope. Dynamically available in the graphs window and also statically adjustable through agc_profile_3.txt file.

The bug(s) fixed where driven by profiles which had funny bumbs which I did not expect and this is taken into account now. Some users had used (as example) 60 for S5, 40 for S6 and 70 for S7... the 40 was not expected and sometimes stopped the program. It is now taken into account as well valid condition.

Another tip; some users never have the RF gain on 100 but instead use it at 80. It is worthwhile then to set the DEFAULT RF Gain at 80 and the program will take this into account. It would also make the zoom function work better. Please keep in mind that all values as given for S7 to S2 should be equal or lower then Default...The program will check and if invalid condition is found the profile will turn red as well error message will be shown in the debug window.

If you have tweaked the agc_profile_3.txt file and found a good working profile for the orion firmware you are using, please share either the complete profile or just the profile line with the group. This way others might benefit from your profile.

In case you have a rf generator with variable output as well an audio card connected to the AF output at the din plug or tulp plug you might want to test the kneepoint yourself, given the firmware running on your Orion.

Test case is straightforward;

1) connect RF generator to orion and adjust output to have S7 indication on main S meter
2) Set both threshold and RF Gain to factory default.
3) Start FFT audio analysis software on computer and observe the level of the carrier captured. Mark the value measured
4) turn up threshold until the FFT audio analysis shows that audio level dropps. This will confirm the threshold kneepoint. Go down a little to have the kneepoint just before S7
5) with threshold at same position, turn down RF Gain slowly until the audio levels starts dropping again. When this happens, turn up RF gain a little, just before audio level drops.
6) now you would have Threshold and RF Gain value matching S7... Write down the two values matching S7

7) repeat the sequence for the other S values [step 2 through step6]

All in all, many users are playing with the settings and good idea's are shared with me on improvements and such like. Thank you all!

Best regards, Onno pa1ap

> Description : Patch update 20135. Changes included: audio presence slope adjustment through window as well agc_profile variable. "bug" repaired in slider zoom function. Cosmetic bug fixed on AGC buttons window; threshold and rf gain now include the true values as found in agc_profile. As well attn buttons are available at first startup. AGC window size (minimal and maximum) can now be adjusted by user through agc_profile file. Please rewrite agc_profile_3.txt file (or delete prior to start).

5967. Power Meter Inop

Yahoo group: orion565 (2009 — 2013)
Date: 2010-03-14 15:02:27 UTC
From: hglent
Topic: 5967 Message: 5967

I have noticed the analog meter that indicates power out is intermittent.

Some times it will show a very close to accurate power reading. Other times no indication. I have tried restarts of the radio, and not gotten any reading after the restart. I have done several master rests and it may or may not work after the master reset.

I just noticed this recently, and have not noticed any other particular sequence of events leading to the problem

Any ideas of where to begin looking?

Paul K.
WA0BAG

Need more info: Can you measure actual power output independently? Is it stable? Is the ALC light on? What does the SWR indicator say?

What firmware version, what operating modes? CW? SSB?

The meter is actually showing the output of a D-to-A converter driven by the control computer. I.e., it could be a firmware issue.

/I got a response regarding inop analog power meter, asking these questions. Here are the responses;/

Need more info: Can you measure actual power output independently?

/Yes. I am using several different metering arrangements. In line and terminated./

Is it stable?

/Yes. I operate at 75 watts. The Forward power indicated on the Bird 43 is stable./

Is the ALC light on?

/Yes, The ALC light is working properly./

What does the SWR indicator say?

/The SWR indicator is showing 1.0:1/

What firmware version,

/Orion 1, Vers. 2.062/

what operating modes?

CW? /Yes/

SSB? /Yes

Last night the meter was indicating properly when I shut down. (Switched Power Off). This morning I switched the power on and the meter was not indicating. I did a Master Reset. The meter is working properly again.

I have not cleaned all of the plugs and connectors. That is my next step. I will use a drop of DeOx on each connector and plug.

Thanks for the response.

do you tuner within the orion and if so, is it inline? perhaps the antenna tuner has an issue? When you observe the issue, perhaps pushing the tune button on/off and see if that changes anything. While testing various firmware i did found a version which did not alwyas clean up the antenna tuner status and hence i had unexpected output...

Best regards, Onno..

From: Paul K.
Topic: 5967 Message: 5972

do you tuner within the orion and if so, is it inline?

I first observed the problem while using the internal tuner. I have a new LDG AT-200pro. I disabled the internal tuner, and placed the new LDG in the line using a very short RG 58 patch cable. The LDG quickly tuned the Omni to the antenna. The power meter did not indicate.

perhaps the antenna tuner has an issue?

I don't believe the tuner is part of the problem. I think I have done all the possible combinations to isolate it.

When you observe the issue, perhaps pushing the tune button on/off and see if that changes anything.

I just tried the tune button to no avail.

While testing various firmware i did found a version which did not alwyas clean up the antenna tuner status and hence i had unexpected output...

Best regards, Onno..

I have not gotten time to get into the rig and do a cleaning and screw tightening job on it. I think the next step is, put this issue on hold here on the group, and give me time to do my thing. Then if the issue persists I'll repost to the group.

Thank you everyone for the input. I will pass on my finding as I deal with this. The ultimate is, I'll just drive the rig up to the Ten Tec factory and have the tech look at it. TT Factory is only 30 minutes away.

5974. Request for feedback next version

Yahoo group: orion565 (2009 — 2013)
Date: 2010-03-20 22:25:01 UTC
From: pa1ap
Topic: 222 Message: 5974

Greetings,

I am writing the function for auto threshold / rf gain adjustment using the s meter indication as retrieved through the serial port.

The goal is to sample the s meter indication a number of times, derive minimal, average, peak values and combined with a weight factor this would drive the S meter buttons in the program. Then it would be a matter of pushing "auto" and the rig will adjust itselve in 1-3 seconds, depending on the sample parameters. So far using the minimal values seem to work just fine. When AGC is off the measurement is most accurate of course, would that be acceptable for 1-3 seconds? The speaker could be muted during the sampling...

Interested to learn other thoughts and ideas on how to taggle those challenges.

Best regards, Onno pa1ap

Onno,

Give it a try at 1 second and leave the speaker ON and lets see if that is objectionable. If the speaker is objectionable during the sample then it could be muted
during that period.

Speaker and headphone follow a different audio chain and given the fact your headphone keeps working as designed, the issue is within the speaker chain. I remember a posting from an Itilian ham reporting his audio started popping afte a while and they (tentec) replaced the capacitor connecting to the output connector. If you have an oscilloscope you could do the tracing to check where the audio stops working... Another point to check is the 6mm audio jack connector (assuming you are using external speaker) and wiggle it a little. Mine had an issue making poor contact, resulting in bad sound throuh the speaker.

If the headphone keepsworking the good news is that all common logic prior to the audio chain is working just fine. It should not be a big issue to solve.

Thanks for the info, Onno. Yes, it sounds like a capacitor heating up and changing value. Where can I find service info like a schematic of the speaker audio amp and the location of the circuit board? The older Tentec radios have all this info in the operating manual.

How hard can this be? Every Tentec radio I have owned has included board level schemetics in the operating manual. The Orion I manual does not include these and I can't find them on the web site. Where are they? I don't want to pay $200 plus dollars and risk UPS just to fix a simple audio problem!

Again, I am requesting board level schematics/parts lists so I can fix the problem myself. If they are on the web site and I have missed them I apologize. If you have to mail them to me, I can live with that. Where is the Tentec service help I have grown used to prior to the Orion?

Dear John:

This is not a common problem. Only way to repair the problem is the have the
Orion on the bench and carefully trouble shoot the problem. Schematics for
the Orion are available for down load on the Ten-Tec web page. We would be
happy to take a look and solve the problem.

Paul, if this has been an issue in the past, will you please research it and send me enough technical info so that I can replace the capacitor myself. I really don't want to sent it back to the factory

as I have already spent $400 on factory work in less than a year. Thank you.

If the headphone keepsworking the good news is that all common logic prior to the audio chain is working just fine. It should not be a big issue to solve.

Best regards, Onno pa1ap

5994. Erratic Orion performance

Yahoo group: orion565 (2009 — 2013)
Date: 2010-04-03 00:53:50 UTC
From: Bob Glasscock
Topic: 5994 Message: 5994

I've had my Orion for about four months and have had some problems that don't seem to have a logical explanation. Occasionally, the main receiver will go blank requiring a cold restart, which normally cures it. Then, from time time, the RIT and XIT will not work (main rcvr). I use HRD for CAT control about half the time and am using a MicroKeyer II for digimodes and CW. Does this sound like something a firmware update may cure or is it going to have to go to the TT Infirmary?

Bob,

It sounds like you are having trouble with the connector that is mounted on the back of the row of buttons starting with "MENUS" on the right side of the display. Press along the edge between the buttons and the display. That will "exercise" the connections. If that clears up the problem, you need to clean the connection with DeoxIT DN5 and then protect the connection with DeoxIT shield S5. That is what I had to do with mine.

If you have the external "tuning" knob, you can change the menu setting to make the knob the RIT. It will not be erratic since it connects to the processor board with ribbon cable which is not the problem of the long pins that plug into the connector behind the buttons.

73,

John

5997. New poll for orion565

Yahoo group: orion565 (2009 — 2013)
Date: 2010-04-04 09:32:10 UTC
From: orion565@yahoogroups.com
Topic: 7 Message: 5997

Enter your vote today! A new poll has been created for the
orion565 group:

Greetings,

The Orion AGC program has been around for a while now.
Several versions have been posted and got downloaded by many people.
The youtube movies have been visited frequently as well around the world.
I am curious about your findings and appreciate if you could leave your vote behind in this voting section.
Please keep in mind that this program has been made available as shareware.
If you like to leave comments send me a personal message or leave a message in the forum for others to read.
Thanks for your feedback, 73 de pa1ap.

/// Please only vote if you have installed and used the program....///

o I am using Orion 1, firmware 1.x
o I am using Orion 1, firmware 2.x
o I am using Orion 2
o I am using the program on regular basis
o I am not using the program anymore
o Nice way to experiment with AGC
o The firmware profiles are usefull
o The program is user friendly
o On AGC model; I prefer to use RF Gain only
o On AGC model; I prefer to use Threshold only
o On AGC model; I prefer to use RF Gain / Threshold combined
o Adjusting AGC does improve the audio presence
o I would like to see more / different functionality

To vote, please visit the following web page:

Dear OM,
I've bought a Ten Tec Orion 565 and RIGblaster Nomic sound card interface.
I've some problem to set menu to working in digital mode (PSK, RTTY, etc.)
There are someone to help me to set radio and soundcard menu?
What is your setting?
MIC input or AUX input?

Please answer to my email address: iz2gaj_paolo@...

Thanks.

Best regards.

I had to do a master reset to get the S meter to work right and seems I had to increase the mic gain to drive the amp at the same level as before. Also noticed that CAT control does not work - have tried different speeds but haven't found the right combination. Looks like there may be some bugs still. No doubt the noise reduction is much different than before.

The NR is much more aggressive. I can hear some distortion on strong signals even at level 1 and it really reduces the noise on the frequency but in my opinion it is too much.

Dennis and all,

I just came up from checking out the new 2.042A. In my opinion they are "Going from bad to worse"!
The noise reduction is worthless. Rather then having the adjustment set how aggressive it responds
we need to be able to set the amount of noise reduction. Audio is distorted when it is turned on and
weak signals just disappear.
The new S-Meter settings are a joke..A calibrated 50uV signal is reading S-9 +25. and 12db reduction
brings it back to S-9. Linearity anyone??? I never could get the AGC et to my liking. and the AF AGC
keeps the S-Meter hanging near the top of the scale. A Master Reset would help for a little while but
it would then go back to hanging up. I wish they would forget the AF AGC altogether.

The new spectrum display gets rid of the red flash and picket fence but now we have a white flash
that at lest doesn't stay on the screen.

I think I am ready to go back to 2.039d.

Thanks for letting me rant a little. I would just like to know what they are trying to do with the
software programs.

73,

Jim K4DLI

6008. Ver 2.042A

Yahoo group: orion565 (2009 — 2013)
Date: 2010-04-14 02:49:35 UTC
From: pflueger46
Topic: 6008 Message: 6008

Well I downloaded the new version and now I cannot communicate with any of my software, such as, Dxbase 2007, N1MM, HRD, N4PY etc. I wanted to go back to the version I orginally had which was the Beta version but it apparently has been removed from the site. I know that there is a page that has all of the previous versions for the Orion II some where out there so please advise.

The audio is also so raspy that it is not real pleasant to listen to. Using the DSP of 1 just about shuts the receiver off. I just hope the folks at Ten Tec reads this.

Thanks Ed.. AB4IQ

Alan;

Thanks for the link. Looks like the new release is full of bugs.

In my opinion this guys at tentec just don't test out the firmware correctly.
How can you releise a firmware that has so many errors.
The AF AGC doesn't work well. If you use the manual notch in the AF AGC the radio just lost reception.
If you go to RF AGC the AN is worse than ever even at level 1 it just has mayor distortion.
The NR is now useless in my opinion. Even at level one the NR is too strong.
Why would you want to public a firmware that is good for nothing???
Why do other brands have an UPgrade when you change the firmware while tentec seems just to DOWNgrade???

TENTEC PLEASE CHECK THE FIRMWARES BEFORE YOU RELEASE THEM. DON'T USE US AS YOUR LAB MICE.....WE ALL BOUGHT YOUR PRODUCTS BECAUSE WE THOUGHT THEY WHERE THE BEST, WHY MAKE THEM WORSE?

6013. Orion II 2.042A

Yahoo group: orion565 (2009 — 2013)
Date: 2010-04-14 04:45:29 UTC
From: ai4dq@aol.com
Topic: 6013 Message: 6013

Well hard to be live this was released , the Mic gain setting you had throw them out the window . I am still not satisfied with the setting TX is not driven as before 40 watts use to drive my Acom 2000 A 1500 watts now it takes 58 Mics gain now is at 26/24 SP is now 4/ 3 H/W Mic gain 7/2.5 This almost get the rig back to driving to full 1500 watts on the amp. I am running the 707 Mic still not sounding good . Now the noise reduction improvement is nice and the auto notch works . Do your self a favor quick check shows a host of issue . Maybe released a work in progress ,and not the real mcoy.

This is not Ready for Prime Time.

Big problem when the basic audio setting are screwed up , and when you finely get the radio to drive right you cant audio to sound worth FRAK!

Thanks for the information.

After reading all this I won't waste the time to load it.

Oh well......I'll stick with the K3 and keep the 566 for back-up.

Maybe next time

I just went back to the ham shack to check out the reports of not being
able to communicate
to the O2 with the new software installed. I can't. None of my programs
that usually talk
to the O2 would do anything. I reinstalled 2.039d and everything works
as it should.
I have also had the other 2 beta versions installed and they worked OK
but with some
problems.

What is going on with Ten-Tec??

I reported my findings last night on the the operation of the new
software and did not
check communications at that time only reception , which was below par.

I think they have great hardware and general this is the best receiver I
have had
in 50 some years of hamming. However, the software implementation sucks.
If they
don't get it right in a short while I think I will put my O2 on the market.

Hmmm.......maybe its time to have a look at the source code. How proprietary is it? Maybe it's time to look at technically able owners/operators to producing their own fixes. This technology is not new. To an extent, the ham market is not a huge money maker for some of these companies. Could be wrong, but perhaps it's not worth it from a financial position to devote much resource to this problem.

Another oppourtunity maybe. Might be worth looking into.

On an aside, Elecraft can't make the K3's fast enough. Look at their support and presence in the reflectors. It is a different realm. No comparison.

I still like my 566 alot even though it's not used as much since the K3 came here(the 7700's get no use, they may be on the selling block soon).

I don't want to talk ugly about Ten Tec, but their actions in support of the 566 FW have spoken.

I see another great opportunity, challenge, and project.

Could be a lot of fun!

6022. Orion II Firmware Update

Yahoo group: orion565 (2009 — 2013)
Date: 2010-04-15 11:06:52 UTC
From: k3xr@comcast.net
Topic: 6021 Message: 6022

Have given 2.042A some thought and a few points come to mind. Tried to see some humor in the release thinking that the date should have been April 1st, but it's not funny.

Sure a bug is bound to pop up in a new release but it is apparent that this release had very little, if any, testing,, prior to it being posted, as some of the problems are rather glaring.

Seems to me there are some extremely talented folks who are able to work magic when it comes to software and some equally talented folks who can sit down and design wonderful transceivers. What seems to be lacking, or at least limited, is the talent to marry all of the above.

I look at the date of this release and the date for the Dayton Hamfest and think of the possibility that Ten Tec may have been in rush to have the new release coincide with the Hamfest , sort of a "look what we have done for you lately" type of thing.

Not a Ten Tec basher , in over 50 years on the air have owned many and enjoyed operating them all, have even had review articles published on Ten Tec gear. Their service is second to none.

Don't expect I will be around for another 50 years let's hope that's not the case with Ten Tec .

DAN, K3XR

I agree 100%. I've been in Alpha and Beta testing for many MAJOR software corps. over the years including Microsoft, Adobe, Mozilla, and REB Inc. just to name a few. I've signed agreements with those companies that state I will not share, release or talk about the "secret" code. That gave me a chance to use, evaluate and in some cases modify code and report back to the software author daily. All in all it made for a much better end product.

Think about it TenTec programming, we are here to HELP, not hurt your company.

6025. Orion Firmware- perhaps something positive!

Yahoo group: orion565 (2009 — 2013)
Date: 2010-04-16 01:16:45 UTC
From: Rick W
Topic: 6025 Message: 6025

In January of 2009 I joined the Omni VII group on Yahoo. I did not, and still do not, own an Omni VII., however, I had heard a lot of good things about the Omni VII firmware development. As an Orion (565) owner this caught my interest.

As I monitored the Omni VII list it was quite refreshing to see how Ten-Tec, represented by John Henry, took an active part. User's remarks and suggestions were openly discussed and often incorporated into the next firmware release. Quite a contrast from the way Orion firmware seemed to have developed in recent years.

Like other Orion owners I have openly voiced my concerns about the lack of adequate firmware "fixes" for the Orion and Orion II. At times I almost threw in the towel and moved on but now I am encouraged. I definitely see the return of John Henry to Ten-Tec as a positive addition. I also feel that for John Henry to come on both the Ten-Tec reflector and the Orion Yahoo Group this week as a BIG step forward.

Hopefully this will mark the start of a new approach to Orion firmware development. I know that others may not agree but, in my eyes, the events of the last few days have made me more positive about the future of my Orion than I have been for a long time!

73,
Rick

I love my ORION II but I have been very frustrated about the "no response" attitude of TenTec. I still believe in them and feel strongly about buying home-grown stuff (yes I know about possible foreign parts being used too, it's nearly impossible not to) I hope that they are going to develop a better "communication" attitude towards their loyal customers. They deserve some explanation as to the lack of response and progress of this certainly not "cheap" radio.

73, Tony VE3DWI / K8DWI.

I agree 100%. I've been in Alpha and Beta testing for many MAJOR software corps. over the years including Microsoft, Adobe, Mozilla, and REB Inc. just to name a few. I've signed agreements with those companies that state I will not share, release or talk about the "secret" code. That gave me a chance to use, evaluate and in some cases modify code and report back to the software author daily. All in all it made for a much better end product.

Think about it TenTec programming, we are here to HELP, not hurt your company.

Hmmm.....maybe its time to have a look at the source code. How proprietary is it? Maybe it's time to look at technically able owners/operators to producing their own fixes. This technology is not new. To an extent, the ham market is not a huge money maker for some of these companies. Could be wrong, but perhaps it's not worth it from a financial position to devote much resource to this problem.

Another oppourtunity maybe. Might be worth looking into.

On an aside, Elecraft can't make the K3's fast enough. Look at their support and presence in the reflectors. It is a different realm. No comparison.

I still like my 566 alot even though it's not used as much since the K3 came here(the 7700's get no use, they may be on the selling block soon).

I don't want to talk ugly about Ten Tec, but their actions in support of the 566 FW have spoken.

I see another great opportunity, challenge, and project.

Could be a lot of fun!

My take on all this is that John Henry did not mastermind this latest release of firmware. In working with the Omni 7, John was very through and communicated a lot with hams who owned the Omni 7.

But from John's post to this forum, if he wasn't involved before, he is right now. So that will be good and things will get done.

From Ten Tec Website
they have heard it all loud and clear
and are responding
see below response

Orion II Information - 2010-04-15

We want to thank everyone for their inputs on the Orion II firmware
release 2.042A. We are reviewing the issues right now.

We have taken 2.042A down for the time being

Firmware Version 2.039d & 2.041XT ☐ has been reposted for you to fall back to if you have issues with the current version. Visit the Orion 2 Downloads to download this update.

Thanks,
John Henry, KI4JPL
TenTec Engineering

How about that?

Still a great XCVR.

At least the makers/co will respond in public forum.

The asian mfrs will commit suicide before they admit to a mistake.

We need to make this stuff in the USA, and pay more for it if we have to. At least for now. Lets be producers instead consumers on the cheap. Cheaper is not always better.

My 7700's go on sale soon.

6031. Orion firmware - A refreshing change!

Yahoo group: orion565 (2009 — 2013)
Date: 2010-04-17 02:43:43 UTC
From: ve7tk
Topic: 6008 Message: 6031

The message below was posted on the Ten-Tec group earlier today. A VERY refreshing change.

73, Rick
VE7TK

----- Original Message -----
From: "Henry, John" <jhenry@...>

Sent: Friday, April 16, 2010 4:29 PM
Subject: [TenTec] Orion II Firmware Status Update April 16

This posting is to help keep our valued customers up to date with the current status of the Orion II firmware.

We have distributed a new beta version of the Orion II firmware for testing by a small group of your peers for the weekend.

We still have a set of measurement tests that we want to complete before we can give this beta firmware the green light to post for public use.

If all goes well, this firmware will still post as a beta because we are still ironing out AF AGC and a few other related items. Once AF AGC is ironed out in a future release, that release will be posted as a production release.

Installation of our beta firmware is of course purely voluntary.

Thanks,
John Henry, KI4JPL
TenTec Engineering

Topic: 6008 Message: 6032

I am sure TT will go after this release and get it perfect or at least for the most part straightened out. But I am more interested in how this happened. How in the world could this have slipped by any kind of "ready to post" review? I think back to the early 565 V1 releases. There was a beta team of high power users who put the releases through their paces over the air and gave feedback to TT before the betas were released more widely. The process wasn't perfect and there were many, many point releases. The "it's really sensitive to RF in the shack" lockups the 565 was known for were gradually recognized as defects in the firmware or things that could be cured by firmware sanity routines. Then for reasons discussed and speculated about on this reflector long ago, the beta team process was stopped and by the change to version 2 firmware, releases were held within TenTec until release. At that point different sorts of squirrely problems started to develop. After very, very long development periods a release would be posted and it would immediately be found by the user community that things which were not supposed to have been touched had somehow been changed for the worse. I recall gain allocations, audio performance, and AGC performance were issues. It seemed that one major item would be improved or fixed, but several other things were broken unintentionally. There was feeling on the reflector that whatever testing had been done had focused on the major thing changed but that overall performance had not been checked in detail before release-at least not by an team of experienced ham operators. And now we have a totally bonkers release which must have gone through a very ineffective release process. I'd like to understand what the root cause of the problem was and how TenTec is going to tighten up their procedures.

From what I understand, TenTec concluded the beta review teams from 565 version 1 days had turned out to be a PITA, but if that's the only way to get things checked out, maybe they should be reconsidered. Given the release rate of the Elecraft and Flex more or less public domain firmware, I also think TenTec needs to find a way to shorten their release intervals to stay competitive. There were financial reasons for them not to go to the Elecraft or Flex model for firmware development. Maybe a positive outcome of the recent release issues will be that TT will find a better way to keep their high-end transceiver customers happy while keeping their high-end transceiver business financially healthy. I'd like to see them run circles around the foreign competition-which has put out some very expensive poorly performing transceivers recently.

Rick,

You are missing a good radio. I own not only an Orion II here, but an Omni VII too. I love them both and have my reasons for owning 2 new rigs like this. By the way, I also own an older Jupiter(green screen), and Argo V, a model 526 (6N2) and an RX-320D. Yes....I am a Ten-Tec fan! I'm certain we will eventually see good working updates!

Well Bill not to fear, I too am a Ten-Tec fan.

I have an Orion as my main rig in the shack, an Argonaut V for PSK and backup in the shack and a Scout in my van. (The shack also has a 253 antenna coupler and a Hercules II amp and 9420 power supply.) I've also owned a 509, RX-320, Omni v.9, a 1208 transverter, a Century 22 and other Ten-Tec bits and pieces!

I have heard good things about the Omni VII but resources and my efforts to maintain marital bliss in my 42+ year marriage preclude the purchase of another HF rig at this time - hi!

Finally, I agree - a working firmware update for the Orion looks better than it has in many months!

Well Rick,

My XYL of 39 years, soon to be 40 years, has fortunately allowed me to get the toys to keep busy since I retired. I had to retire a little earlier than I wanted for medical reasons and fortunately, Ham Radio is something I enjoy and keep busy building new home brew items as well. Ocassionally I buy a rig on eBay that isn't working, fix it and I wind up with another toy when I fix it! ;=)

I'm fortunate in that I have all the equipment for this venture. I have meters, generators(audio, RF & function), spectrum analyzer, power meters, etc. I'm also lucky enough to have a buddy who works at a calivbration l;ab and makes sure my goodies are current.

I got my Orion II this way for about 1/3 the regular price. A couple hours and about $7.00 in parts got me a working unit. Can't complain there!

Bill/K1FPV

6037. Subrx dsp filtering problem introduced in Orion v2 firmware

Yahoo group: orion565 (2009 — 2013)
Date: 2010-04-24 12:13:28 UTC
From: Barry N1EU
Topic: 6037 Message: 6037

I made two simple recordings illustrating the subrx cw filter "blowby" introduced in the v2 firmware of the Orion. Hopefully, Ten-Tec can fix the problem on the Orion 1 firmware (don't know if the problem exists on the Orion II).

I waited until now to make these recordings because there's lately some hopeful signs of firmware development (PLEASE don't forget us Orion I users).

In these recordings, I slowly tune +/-10Khz across an s9 carrier. BW is 500hz. There is clearly all kinds of blowby well above 500hz being passed by the v2 subrx dsp filtering. Please ignore all the other spurious clicks and tones and tx phase noise.

http://n1eu.com/orion/1_373b5.mp3
http://n1eu.com/orion/2_062a.mp3

This is the problem that makes it impossible for me to use the v2 Orion in diversity mode on the lowbands where there are plenty of strong local signals present. The v1 Orion subrx doesn't have the problem. This was one step backwards taken with v2 firmware that hopefully will get corrected.

73,
Barry N1EU

6038. Orion 565 suddenly switching off

Sounds like what my ORION II did a while ago. Traced it down to the A9 "POWDST" board (power / distribution). Replaced it and all is ok now. You might want to check the power supply first to make sure it has enough current to handle the radio. Also, look at the in-line fuse holder. For such expensive radios the fuse holder is cheap.

Martin, also unplug the power connector and closely inspect it. I was having similar problems which I thought were RF related, and it turned out that one of the female pins in the power plug coming from the power supply had not been gripping the male pin in the socket tightly enough, and some arcing occurred, which eventually carbonized the connection on the positive side. I replaced the connector and pins and everything is back to normal.

I'd suggest you look at the Power Distribution Board as previously mentioned. Ron N6IE has a write-up on the problem and repair.

http://www.n6ie.com/A9_Fix.html

It's an easy repair just be sure to get good low ESR capacitors..

Good luck.

Martin mine did the same thing and as Gene commented, mine was in the Molex connector. The female pins opened and arched each time I transmitted. THEN the on-board power connector was loose and I just replaced it with a hardwire power cord, works fine now

Good luck

John

I looked at Ron's write-up, and although just replacing the caps with those he mentions might do the trick, it did not in my case. I suspect one of the IC's went bad along with the caps. Either way, mine was under warranty and Ten*Tec replaced the board overhight FedEx Red at their expense.

6046. Re: Orion RIT encoder

Yahoo group: orion565 (2009 — 2013)
Date: 2010-05-08 01:41:18 UTC
From: k7na6
Topic: 5935 Message: 6046

I thought I would offer some advice regarding the intermittent RIT/XIT issue on my Orion 1. I started experiencing the problem within a year after I had Tentec make the V2 mod for me at the factory. After three years of living with the issue, pressing the front panel near the "Sweep" button for a temporary reprieve, I contacted Tony at the factory. When my unit acted up, I contacted Tony on the phone and he had me try various things such as a master reset, pressing the front panel, etc.
He had me pack up the unit and send it back. Naturally, as luck would have it, the jossling in transit temporarily solved the problem and Tentec was never able to actually see the problem first hand.
Nonetheless, Tony went ahead and made a repair. Quoting from the repair bill, he "replaced all connectors for RIT/XIT circuit on encoder, keypad, and logic boards, 1-#35270, 1-35347, 1-#35348, 1-#35343 and applied Deoxit and Preservit to pins." Additionally, he updated the power distribution board, checked alignment and operation. After the unit underwent a 24-hour burn-in and checked okay, it was sent back to me.
I have used the unit now for about a month and I have not had any problem with the RIR/XIT since. It works flawlessly. Tony called me the other day to check up on how my Orion was performing. He was interested to know if changing out the connectors solved the problem. It appears to have turned the trick! The cost was nominal and well worth it. The service from Tentec was, of course, what we all have come to expect from such a company.
If you continue to experience the RIT issue, you may want to change out the connectors yourself or work with the factory to do the service.

I also had the RIT issue and last year while I had my O1 opened up I decided to go ahead and "reseat" all the connectors and jumpers. Apparently it worked. No RIT problems since then

Good luck

Date: 2010-05-10 14:28:25 UTC
From: Mike
Topic: 6048 Message: 6048

I would like to receive comments about the Orion 565 and it's performance compared with the Jupiter 538 and the Elecraft K3 as well as the OMNI VII.

I have the Jupiter now and am looking to upgrade.

My interests include digital modes PSK31 etc, SSB, SSB Casual contesting, SSB DX, and SSB Ragchewing with a little CW mixed in.

Thanks in advance for your thoughts and consideration.

73,

Mike NT5DX

Hello all,

I just purchased and received a used Orion II. I got a Ten Tec hand mike that I assume came with the radio, however it is not working. I don't believe it is wired properly.

I was hoping someone could give send/tell me what the wiring should be for the stock hand mic. I think maybe someone has been in this one. Pictures would be great too.

Thanks.

Hand mic doesn't come with one new? Wow, that's strange all by itself. Well this is a TenTec hand mic at least. I checked the manual on how a mic "should" be wired, but of course it doesn't have anything on the hand mic itself and what is what. I opened the mic up and was totally confused by the wiring inside to the push button. I tried a few combinations without any luck.

If anyone has a factory hand mic wired for a Orion II, I sure would appreciate a wiring diagram. Thanks.

6054. Omni-VI Opt 3 problem... have you experienced this?

Yahoo group: orion565 (2009 — 2013)
Date: 2010-05-13 16:44:13 UTC
From: jeraldvolpe
Topic: 6054 Message: 6054

This morning when I turned my Omni-VI, opt 3 on it came up in CW, key down transmitting. Cycled off and on and the repeat malfunction. Isolated all connections and problem continued.

Performed basic RESET and transceiver went to 14.000, USB, clock reset to 12:00. But no apparent audio output. From meter indication I could see that the receiver was working. Inserted headphones and with volume advanced full I could must barely perceive stations. BUT none of the keypad buttons function.

Performed Master RESET and the malfunction remains the same.

Note: If holding down any keypad key during start up you hear full audio output until you let go that button... then clock begins and audio becomes muted and no keypad buttons function. Although with headphones on you can hear a stream of fast pulses when any key is depressed.

VFO functions fine but of course you can't change bands, modes, etc.

Removed the cover and did a slight manipulation of all connections on the Logic board.

There is a start up initialization sequence. Unless I miss my guess the malfunction is causing this sequence to not go beyond displaying the and running the clock.

This is as far as I've gone at present.

Most certainly the problem is on the Logic Board due to the issues presented. Beyond that, and before I tear into it.... have you experienced this error? If so what was the eventual fix?

73,

Jerry, KG6TT

Barry,

Would you perhaps have a link to the "General Ten-Tec Reflector"?

Thanks, Tony VE3DWI.

Jerry,
This sounds very familiar, (someone else had this problem and it was discussed/answered in one of the forums) but I do not recall the answer, (it was something simple). As I recall the trouble shooting went something like: disconnect all cables except power and antenna, Turn on radio and see if problem disappears. If problem disappears turn off radio, attach one more cable, turn on radio and check if problem reappears. Repeat as necessary. Leave computer connection for last and interface such as Navigator to second to last.

Stephen AD7TD

From: jeraldvolpe

This morning when I turned my Omni-VI, opt 3 on it came up in CW, key down transmitting. Cycled off and on and the repeat malfunction. Isolated all connections and problem continued.

Performed basic RESET and transceiver went to 14.000, USB, clock reset to 12:00. But no apparent audio output. From meter indication I could see that the receiver was working. Inserted headphones and with volume advanced full I could must barely perceive stations. BUT none of the keypad buttons function.

Performed Master RESET and the malfunction remains the same.

Note: If holding down any keypad key during start up you hear full audio output until you let go that button... then clock begins and audio becomes muted and no keypad buttons function. Although with headphones on you can hear a stream of fast pulses when any key is depressed.

VFO functions fine but of course you can't change bands, modes, etc.

Removed the cover and did a slight manipulation of all connections on the Logic board.

There is a start up initialization sequence. Unless I miss my guess the malfunction is causing this sequence to not go beyond displaying the and running the clock.

This is as far as I've gone at present.

Most certainly the problem is on the Logic Board due to the issues presented. Beyond that, and before I tear into it.... have you experienced this error? If so what was the eventual fix?

73,

Jerry, KG6TT

Hello,

This email message is a notification to let you know that
a file has been uploaded to the Files area of the orion565
group.

File : /pa1ap AGC program/orion_agc_macro_v2032.zip
Uploaded by : pa1ap <pa1ap@...>
Description : AGC macro 2032: S meter based auto sense function finished. Also includes minimized and normal window size. Also all values through agc_profile_4.txt file available. You can have the program start with different values for S meter window. Peak is for local QSO's, minimum (noise) for small signal and average for in between. Enjoy playing with it and let me know how it goes. Tnx and 73, pa1ap

You can access this file at the URL:

John,

You might want to check your subRx AGC settings (and RF gain, of course).
That's one way to deafen your receiver.

John,

A few things I have found that can cause this are:

AGC setting on "Program" with the threshold set too high.
Any of the AGC settings with high threshold or low RF gain.
Sub receiver set to wrong Ant.
Pass Band tuning or bandwidth set too narrow on Sub receiver.

I have been caught several times thinking there was something
wrong with the receiver only to find it was a simple push of the wrong
switch.

Hope you have something this simple.

John,

Another thought might be oxidized connectors. I bought Deoxit cleaner and protector because I have been having problems with my Orion RIT. I traced it to the connector between the CPU board and the PC board mounted on the back of the front of the Orion. Go to the Ten-Tec web site and download the mod instruction for the V2 software if you don't already have it. In the pictures, you will see the connector I am referring to.

Just 2 days ago, I tried using my VFO-B knob and nothing happened. I knew from experience that if I press between the LCD display and the buttons on the right side of the display, it will exercise the connections. As soon as I did that, everything is back to normal. Give this a try and see if that might be the problem before a more radical approach. If it cures the problem, you know that you need to treat the connector. The female part of the connector is mounted right behind the buttons and warping the case seems to make them work again.

73,
John

Yes i have had this problem. My bloch turned up after shipping. I can only think that the LCD was punctured somehow. I thought it may have been moisture but it never went away after leaving it on for almost 1 year. Coincidentally i have replaced mine just last week with a new after market Blue LCD. This looks amazing and makes a massive difference to the look of the radio. I do not know anyone that has done this yet.

I am working through a minor contrast issue at the moment. When its cold it takes a few minutes to come around, but when it does, its pretty nice. I am using the last release software and i know some older versions had contrast issues. Onno Pa1ap talked about a capacitor mod to improve this cold start problem with the original LCD so i am yet to work on this. However, i am pleased with the results having looked at the bloch for almost for 2 years.

As a simple upgrade, this LCD would be a great addition in my mind as it was not costly and pretty easy to change out. I would be willing to post my findings when i have finished if anyone is interested with some pictures.

Hi, Dean -

Yes, I would be interested in your results. Also, I would like a "ball-park" figure on what the blue screen cost to replace. I have not had a problem with my original screen, but it is pretty dull or boring to look at. I suspect the blue screen would give the radio some "personality".

Thanks for any help or advice on this excellent radio.

Hi Jim, well i can tell you its exactly USD $150 plus shipping.

Yes the original screen is very boring and this new blue LCD is a glamour addition. I like the white text on blue, its impressive contrast and lovely to look at. Although the blue text on white is also much better than the original. When i sort the slow warm up, i will post the solution.

Try raising the contrast number slightly in the menu to see if that helps. As you lower the contrast number, sometimes there can be irregulaities in the display that will appear.

We will begin reviewing the current status of the Original Orion V1 and V2 firmware. Assessing open problems, customer requests, etc., and developing a plan of attack. The goal is to resolve open issues and to bring into the Orion firmware the enhancements and reliability that we brought into the Orion 2 V2.043B firmware.

I do have a few beta testers lined up, and am always willing to take in a few more. If you are interested, then send me an email at jhenry at tentec.com. Whereas I would like to include everyone that asks, it is cumbersome to handle a group larger than a handful.

If there are problems that you are aware of in the latest V1 and/or V2 codes for the Original Orion, please send them to me as well. Not every problem will get resolved, but they will at least be reviewed.

Note: I do not read this reflector daily, so if you need to get something to my attention, then please send it to my email address listed above.

Thanks,
John Henry

The new version seems much noisier and the NR distorts the receive audio. I will give it a little more time but it looks like I will be going back to the earlier version if I can't figure out a way to make listening a little less annoying! Thanks John for the continuing effort!!

It looks like they took out the new features of 2.041xt. Waterfall and AF AGC. Glad to see the spectrum scope markers are back. No more red screen issues so far.

Hello Bernie, and everyone else,

The main goal of creating this new release was to resolve the receiver lockups, bring some consistency in how it worked, and improve upon the base. We felt that starting from the 2.039D release was the best way to go. All of the new features built into 2.041 and beyond were really too many changes at once, and hence caused so many problems. That is one reason they were betas though. So that everyone would know that they were a work in progress. We will add the waterfall display back at some point in time, and we will also increase the height of the Sweep because those two features add a lot to different people.

NR has a new algorithm and as I stated in an earlier post, it may seem raspy or noisy in certain band conditions/noise/recovered audio strength situations. However I haven't found a noisy condition that it couldn't handle properly at higher levels. Most situations will call for an NR level of 4 or higher, and very few will call for an NR level of 3 or less, but they do exist.

I do hope everyone has better luck with this one, and as issues come up, please send them to ditsnbits at tentec dot com.

Thank you all for your patience, and I hope this version is more reliable and functional for your needs. With this base code set, we can build on it for the future and make the best HW for a Ham Transceiver in the market today, even better.

Some on the list might take offense at being call "the rabble".

IF there are things on the O2 which needed fixing, and there were, then there is nothing wrong with voicing complaints.

The NR routine seems to be a step backwards. At all settings less than 9, the audio is very crackly. The crackling noise seems to be distortion of the background noise. Even at the max NR setting the crackling is there but on very loud signals its tolerable, on lower signals its still unpleasant. At lower NR levels the audio is very difficult to listen to regardless.

The lower the background noise is, the less crackling there is..

None of this was a problem with 0.39d.

Other than that, this release seems pretty solid so far. Will have to go back to 0.39 because of the NR though.

John,
   I downloaded Version 2.043B and transfered it into my Orion II, but I had problems with the CW sidetone and SPOT function. The sidetone was not loud enough - by far. It seemed the sidetone would be about 30% of what it should have been. The SPOT function produced a correct tone, but it is surronded by hash and scratchy noise.

   I went back to Version 2.041XT because of the sidetone, and the fact that I really like the waterfall display.
Do you think I got a bad download, or have a local problem? I will try it again later.

6089. Re: Firmware Version 2.043B

Yahoo group: orion565 (2009 — 2013)
Date: 2010-06-04 15:29:30 UTC
From: hlmcgavran
Topic: 6075 Message: 6089

For me, there are two problems with 2.043B, one affects me in only a minor way, the other is a major nuisance.

I live in a rural area where I rarely need NB or NR, so the minor nuisance is the way NR works now. The popping does get worse with higher atmospheric noise levels, but with the NR off it's not a problem. I've never had enough man-made noise to warrant running the NR very high.

The interesting thing is though, that the side-tone is subject to the same popping even with NR off, if the side-tone level is set higher than 30. What's really interesting is that I can set the side-tone level higher and not get the popping IF the atmospheric noise is LOWER. With really low background noise I can run the level up to almost 35 and not get any popping. If I run it up to 50 or more the side tone sounds absolutely horrible for all the noise/popping generated with it. This sounds like the same stuff you get with NR set to low levels, but the side-tone popping happens whether NR is on or off.

The side-tone issue is the only one I've found that would send me back to 2.039d, but it seems to be ok if I keep the side-tone level at 30 or less. That's really annoying as the side-tone is a bit soft at that level -- but I think I'll stick with 2.043B as I can manage this way until the side-tone level issue get's fixed and I don't rely on NR very often at all.

Other things look fine so far -- I've managed to try to exercise all the things I usually do and haven't noticed anything else is a problem. Something else may crop up, but if not, I'll stick with this release until the next one.

I'm really happy to see the 10khz frequency offset markers on the sweep. Their absence in the previous releases after 2.039d were greatly missed!

Same NR problem here. NR setting 1 thru 8 are useless to me. On setting 9 it helps but still adds NOISE. Shold relabel as NA (Noise Addition). I'm going back to 041XT, at least the NR worked good for me.

Thanks John. I am betting on the future so I have decided to stick it out on the new version. I have found although there seems to be more "white noise" than before, I can simply turn the NR off and it is not so bad (just not as smooth to listen to as previous versions). If you say this is a more stable foundation for moving forward, then I can grin and bear it. Just hope the improvements and innovations come a little faster than what we have seen the past couple of years. Thanks for putting forward the effort to keep the Orion II a great radio!!

Hi Bert et al...

When I repowered the radio after the initial master reset, the cw sidetone low volume issue disappeared and has not been heard from since, pun intended .

I use the BinRx feature whenever I'm using headphones. One oddity that I did notice is that when the radio is booted up, the sound comes through the left phones but not the right. If I scroll through the BinRx entries back to BinRx Main, where I usually keep the audio setting, then audio returns to the right earphone. This reminds me of the quirk of losing headphone audio with one of the 01 versions if the second receiver was set to AM....Ah, the wonders of software radios!

We all have different needs and expectations, and a version of software that works for one person might not be good for another. I run nearly all cw with dxing, rag chewing, and some contesting, and my needs might be completely different from someone who does just SSB or digital. I think 2.041xt and 2.039d are both keepers, especially the band scope display in the 2.041xt, but more people by far prefer the traditional display.

In any case, the Orion receiver is superb. It even beats the Omni VII hands down. That's the good part of this radio, with whatever software is driving it.

Many thanks to John and for the efforts of the software team, and especially for keeping everyone informed.

6093. Re: Firmware Version 2.043B

Yahoo group: orion565 (2009 — 2013)
Date: 2010-06-05 15:04:27 UTC
From: Harry G McGavran Jr
Topic: 6075 Message: 6093

There are a number of things I like about 2.043B -- one seems to be
that the CAT interface seems a tab more robust. I might just be
dreaming it, but I've written a number of programs for my Orion II
that use the CAT interface and one problem has always been that
if one is sending a long sequence of commands that don't generate
responses to the Orion, some of the commands are not executed
by the Orion. Increasing the delay between commands helps, the
the delays required seem to vary in not so predictable ways.
That problem SEEMS to be better than with 2.039d.

BUT -- I really really dislike to new NR algorithm -- particularly
as it affects the side-tone, even with the NR off. After a couple
days of operating with 2.043B, I finally had enough and went
back to 2.039d. It seems to me the new NR algorithm is doing things
even when NR is off... I hope the next release either reverts to
the old NR algorithm or gives the user a choice of which one he wants.
In any case, the side-tone is atrocious unless kept at very low levels
and/or NR is invoked at fairly high levels. For those of us in
very quiet locations, that drives me nuts.

73,
Harry, W5PNY

Yahoo group: orion565 (2009 — 2013)
Date: 2010-06-05 15:58:56 UTC
From: Andrew B. Steen
Topic: 6075 Message: 6094

I have a question? I read a lot of reviews about the problem with the NR. If one lives in a very quiet location, why would one be concerned about the NR, other than the occasional need for temporary local noise problems? Thanks.

Andrew

To: orion565@yahoogroups.com
Subject: [orion565] Re: Firmware Version 2.043B

There are a number of things I like about 2.043B -- one seems to be that the CAT interface seems a tab more robust. I might just be dreaming it, but I've written a number of programs for my Orion II that use the CAT interface and one problem has always been that if one is sending a long sequence of commands that don't generate responses to the Orion, some of the commands are not executed by the Orion. Increasing the delay between commands helps, the the delays required seem to vary in not so predictable ways. That problem SEEMS to be better than with 2.039d.

BUT -- I really really dislike to new NR algorithm -- particularly as it affects the side-tone, even with the NR off. After a couple days of operating with 2.043B, I finally had enough and went back to 2.039d. It seems to me the new NR algorithm is doing things even when NR is off... I hope the next release either reverts to the old NR algorithm or gives the user a choice of which one he wants. In any case, the side-tone is atrocious unless kept at very low levels and/or NR is invoked at fairly high levels. For those of us in very quiet locations, that drives me nuts.

It seems the distortion when using SPOT can be temporarily cured by turning down the main AF volume then turning it back up. That works thru a power on/off cycle but the problem comes back if you change modes.

Because the artifacts of the new NR algorithm are present
even when the NR is off! The side-tone through the speakers
with the SPOT button is particularly affected.

Hi All, I am new to this group, however not new to Orion 2. I have owned two during the past 5 years and love hoss trading. I traded my last 02 about 6 months ago and miss it. I am looking for a fully loaded O2at with desk mic, antenna tuner, encoder pad and all filters. i sold my loaded O2 for $2700 and passed on one last week for the same price. Timing was bad. My xyl wanted a new deck and it won out over the rig hihi. We have reached an agreement and I can buy a new toy. Let me know if you have what I am looking for.

6098. PowerSDR-IF & N4PY linking document

Yahoo group: orion565 (2009 — 2013)
Date: 2010-06-09 20:41:40 UTC
From: Rick W
Topic: 6098 Message: 6098

The PowerSDR-IF and N4PY software for use with the LP-PAN (or similar) panadapter has undergone many rapid changes over almost 2 years since my original document. So there was a SERIOUS need to update the documentation. The updated documentation shows how to get PowerSDR-IF panadapter software working with N4PY Orion rig control software WITHOUT the need to use LP-Bridge software. In addition, it provides detailed set-up instruction allowing N4PY to be used with programs such as CWSkimmer, N1MM and PowerSDR concurrently.

The set-up is not "plug-n-play" but hopefully users will find it clear enough to get the necessary programs linked and working.

Please note that the most current version of this and other
documentation is available on my website. Enter the site and then go to "Ten-Tec Information" and click on "LP-PAN/Orion".

As always, comments appreciated.

Hi Andrew,
While "noise fighting tools" are often used against "local noise sources," there are cases where they can be very useful against propagated noise. Noise blankers are often used to minimize the impact of "over the horizon HF radar systems," such as the one used by the Chinese. "Noise Reduction," depending on the algorithm, can be useful in notching out propagated noise from the passband where there is no "coherent" signal. This can be used to notch out QRN from the areas of an SSB bandwidth where is no "instantaneous" voice energy. In cases like this, the filter gets "torn down" and rebuilt as a person speaks and the frequency of the voice changes (Thus the balance between some distortion inserted into the signal from rebuilding the filter and the benefit of removing the noise). Other NR systems can act like an "adaptable" low-pass filter to reduce high frequency noise from a sideband signal, depending on the voice frequencies being used. Of course for CW, the best thing you can do is reduce the receive bandwidth as far as you can while still copying the CW signal - whether done by switching in narrow IF filters or with a DSP bandwidth control on a rig like the Orion.

While it is not always useful or needed, the Orion noise reduction plus a narrowband IF filter and with DSP bandwidth pulled in to 100Hz has given me a number of new ones on 160m cw which I could not have worked otherwise. It takes a while to get used to the DNR and making it effective.

6102. Orion 2 Firmware 2.044A Released

Yahoo group: orion565 (2009 — 2013)
Date: 2010-06-10 20:59:25 UTC
From: John
Topic: 6102 Message: 6102

We have released a new set of firmware for the Orion 2.
This addresses mainly the NR issues and partially addresses the SPOT Tone issues.
Feedback is welcome on these or other features, only makes the rig better for everyone.
If new issues arise, please feel free to post them to ditsnbits at tentec.com.

Thank you,
John Henry, KI4JPL
TenTec Engineering

The NR is much improved over2.043.

I don't know if its my imagination or not but the receive audio seems to sound better as well.

Its good to see Ten Tec addressing the issues quickly !!

From: Harry G McGavran Jr
Topic: 6102 Message: 6106

With this one I can set the side-tone level all the way
up to 65 before the pops begin, and by the time one
gets past 80 on towards 99 the distortion on the
side-tone is still really bad -- BUT -- for me at
least, levels are 50-60 are all I need and that is
now distortion free, at least with a 610 Hz sidetone
which is the only one I tested or use. I also am
using the speaker and not headphones for this.
Since one gets the side-tone every time the SPOT
button is used, the side-tone distortion was really
objectionable with 2.043B.

The NR seems better too, but most all the time I don't
really need it -- and it's nice not to have artifacts that
sound like NR action on the side-tone which the side-tone
is set to 50-60.

There are a few CAT wierdnesses here and there, but the reliability
of sending a strings of "*" commands seems better.

Unless something else crops up, I think I can live with this
release...

So far the NR seems to be a big improvement and likely the best to date. Previous versions changed quality of audio on CW and SSB. This version seems very good at all settings on SSB alters CW slightly. As you go from setting 1 to 9 the level changes are clearly detected. This is how my ears hear it, may be different for you. Next to my O2 is an Omni VI plus, still one of TT's best NR functions. As to the other changes, not explored them, yet. The NR, when it comes to reducing band noise, has always been a big issue for me.

Hello!
I have updated my Orion 566 some times in the past without any problem,
but updating to v.2.044a led to unfortunate results.
At first I launched 566-Setup-2.044a.exe and after installation got 566v2.044A.ruf file, then
I turned TRX on holdindg USER2 button, got " Flash update mode" on TRX screen
and begun Update. But after some seconds the follow Error report did appear, look file above, please!
At the same time on screen of the TRX appeared message "Erase flash" above the message " Flash update mode",
and then messages "Program flash 1, Program flash 2 ....Program flash 26".
Now when I turn TRX on the white screen with TEN-TEC logo does appear and TRX stays in this status permanently. I tried to make Master reset but without any success- TRX just does not switch to Reset mode,
although I hold Main RX/TX button 5-10-20-30 seconds when turn TRX on!

HELP PSE!!!!

Did you try to reload the FW?Start the update procedure from the beggining.

73

Yes Fotis, I did try some times and every time I have the same result:

"When I turn TRX on the white screen with TEN-TEC logo does appear and TRX
stays in this
status permanently."

Have you done:

1) MASTER RESET (see Chapter 4 of Orion manual) and

2) RAM-Clear (see FILES section of this Yahoo group)

3) Reload firmware.

Hopefully this would give you a clean slate and install the firmware without a problem.

I had the same situation once,but I resolved it reloading again.
(Try turning on the radio with USER2 pressed etc)

If the radio stays with white screen and TT logo ,I think a reset doesn't solve the problem.My opinion is that reloading the FW is the only solution.
If all these fail ,next step is contacting TT service for advice.

I can't think of anything else...sorry.

I had the same thing happen, and pressing USER 2 while booting up brought up the Ten Tec logo. I then reloaded the current firmware version and all was well.

Martin,

I am sure there will be an update for the Orion 1 soon. See the original "what's next" post asking for beta testers here:

http://groups.yahoo.com/group/orion565/message/6074

I think a few people may have missed the Orion 1 reference.

I look forward to the next release for my Orion 1.

Received the replacement LCD (only available when old LCD is defective) and installed it into the Orion 565... I am wearing sun classes from now on :-) Time will tell how it behaves, so far it is ok. I have uploaded a picture within the photos section, look for "now it is blue" folder.

Some observations:
1) white on blue works well. I am happy with it.
2) blue on white is not so good, it has some refresh issues
3) it runs well on release 1 and even better on release 2 firmware
4) brand and documentation available on the internet, so finally we have technical docs on the screen & control

Ten-tec has been very friendly providing excellent service. They warned about the refresh issue (jitter) when blue on white and shared this replacement is really intended for replacing defective screens only.

cheers, onno

Just to add to what Onno has found, I think it is worth noting that there will be some variation in what others will see using this screen. I see slightly different contrast results even after replacing the electrolytic caps in the power board. I will work with Onno on this as often as i can. I may have some other issues elsewhere that require attention yet that he has pointed out and share those when possible.

However, i get good results on both white on blue and blue on white. Swapping between either state even with the old screen was never very good. The contrast setting needs to be heavily altered for me to run one or the other well.

The biggest issue i have is on start up from cold. With white text on blue - If i have an optimum contrast setting so it looks fine to start with, it changes after 5 mins. I start to see a purple blue colour after a period of time and then need to up the contrast setting to regain the blue look from a reasonable angle. I tend to leave the rig on and i love how it looks.

With blue text on white, its even more critical that the setting is right. At the start from cold, i see dark areas as if i have too much contrast but then leaving it for 5 mins, it clams down and looks good. Version 1 software if not good for me, but version 2.056 is the best i have experienced so far.

regards,

Dean

Hello.

By chance would this screen be the one used on the new Jupiter?

In complexity, how would you rate the replacement

for a non techy from a scale of 1 to 10?

The photo looks FB.

I don't know if this screen is used for Jupiter. Interesting to know if Jupiter has cold start contrast issue as well...There are a couple of things I noticed which might be valuable to know:

1) Just follow the mod V2 procedure to replace the screen works just fine
2) The screen is connected through a cable instead of the original connector. And here I found an issue. The original pins on the logic board are long and can touch the lcd pcb, causing all kind of funny things. I have included a layer of 4 pieces of tape to ensure the lcd pcb remains isolated...
3) yes, my screen has to warm up too.... I am back to the drawing board again to investigate whats going on... The good news is that the manufactor is known and schematics are known and I am comparing the specs with what the Orion offers to the screen. According the schematics the screen has on board negative power to use for contrast, this might be a way forward.
4) There is Jitter on the screen, especially when using blue on white. Since the Jitter depends on the firmware version this seems related to refresh sequence etc. White on Blue is much more stable to use.
5) Confirmed contrast has to be adjusted (a lot) when switching color scheme. This was also the case on my original screen, so that seems to be normal behavior. What I did notice is that the contrast setting area seems a lot smaller then the orginal screen. The difference between low and high contrast is just a small step on the contrast potentiometer.

On replacing the screen, well it is hard to judge how easy / difficult it is. You will need to follow the logic board modification procedure and ensure you remember which screw belongs where. I found it less complex then following an IKEA do it yourself instruction manual (I always have to much / little screws with that company).

cheers, onno

The contrast issue is actually described in the vendors documentation. Since the unit warms up it is expected lcd contrast to change. There is a simple circuit which will adjust contrast when temperature changes.

http://www.newhavendisplay.com/app_notes/Temperature_Compensation.pdf

Making progress and it seems right now all we need to do is connect the correct NTC thermistor to the existing circuitry. I need to figure out the correct curve and the check what the best location would be to adjust the voltage towards contrast. This would also be a good modification for the black / white screen units which do show contrast variation...

From a design point of view I am getting the impression the screen is getting to warm at a certain point in time. Then contrast is not good anymore. This was also for the old screen.. Seems heat is building up within the unit and it cannot cool down. Easy to notice by touching the top of the rig and you will feel it is warm after 30 - 60 minutes. This is a second point of attention, to see if there is a way to have better screen cooling.

The document in the link has been very educational for me.

Best regards, Onno

> > 5) Confirmed contrast has to be adjusted (a lot) when switching color scheme. This was

also the case on my original screen, so that seems to be normal behavior. What I did notice is that the contrast setting area seems a lot smaller then the orginal screen. The difference between low and high contrast is just a small step on the contrast potentiometer.

Hello Onno

Thanks for taking the time give a detail response.

I should have looked and taken notice that the Jupiter Blue

screen is a different size to the Orion.

I have both sitting side by side.

However, still interested in your endeavor with

the Orion.

6128. Re: orion 1 screen

Yahoo group: orion565 (2009 — 2013)
Date: 2010-06-19 22:34:12 UTC
From: pa1ap
Topic: 6066 Message: 6128

Greetings,

I have to order the components but I believe i have found a simple solution to the problem. I learned a lot from the application note :-)

Using one resistor and a thermistor it should be possible to make the contrast control adapting to the temperature of the crystals automatically.

Here is how;

1) on the logic board the lcd control is included. schematic 81917 A7
2) resistor R714 is the one I will connect the NTC and resistor too
3) NTC (6K8) and resistor (3K3) are in serie
4) combination will be mounted parallel to R714
5) NTC will be mounted at the top of the lcd screen (the back). Hope that is the right place, experimenting will be needed

Here is the background;

Following the screen document, when the lcd screen is cold, it requires more voltage to make the crystals happy. When it heats up, you need to reduce the voltage.

At cold start R714 needs to be as high as possible. When the NTC is cold (resistance high), it will have little influence on the total resistance. Voltage to screen will be highest. Draw the resistor chain and you will see what happens...

When temp rises, R714 needs to become smaller. The NTC will heat up and its resistance will drop. Voltage to the LCD screen will drop because of this.

Of course the R/T curve is important and with some tweaking on a spreadsheet I arrived at the following components;

6.8 k 2003 3980 ±3% B57891M0682+000 (Epcos)
and the 3K3 metalfilm resistor..

From what I understood in the document, for a temperature change between 15 and 25 celcius, the voltage needs to drop about 0,22 volt from the reference voltage. The combination NTC / resistor makes it compliant to this. For higher temps the same applies but at high (50+) the compensation will be a little lower then needed.

One things for sure, it is clearly explained in many documents (once you know what to look for) that all lcd screens suffer from temperature change due to crystal sensitivity and its normal that a temp sensing circuit is included to compensate for this... except for the orion 565...

Best regards, Onno

Just bought a used orion last week.. when i first hooked it up the s-meter light flickers, i thought it might have jarred something loose in bringing it home... I downloaded the new firmware, and now at times it seems as though i have the agc turned off, i'm using settings i got off here...
Is it possible i need to reseat boards or what....
Any info would be appreciated....
thanks
Terry

6132. Dragged out dahs on O1

Anyone seen long dahs when too many button are on? I was having a lot of QRN etc and played with all the button, forgot to turn them off, and the Orion I would drag out the dahs even when playing the send1-3? TT said I was over loading the processor? Interesting solution to me. tks rich

I've found on several occasions, after a firmware update it is necessary to do a ram clear. I suspect variable locations get moved around a bit when the firmware is modified and what gets loaded (relatively dynamic data like AGC settings) isn't exactly what it seems. A firmware update does not seem to clear memory locations, so whatever junk might be there is often still there.

It would probably be a good idea to do a master reset and then the ram clear. You might want to jot down any settings you have changed so you can re-enter them once the resets are done. You will need to redo any CW or Voice memory recordings afterward.

I would check things before making any setting adjustments (after the resets), just to be sure everything is working as it should with the defaults.

You can check here for the reset procedures:

http://wiki.contesting.com/index.php/Category:TenTec_Orion

Good Morning!

I'm a bit surprised because, each time I've updated my Orion II's firmware, my memories get cleared out. I have to re-set them each time. After reading all the positive comments regarding the new update 2.044A, I updated my Orion II this weekend. Sure enough, My memories were wiped out along with all the menu settings. Fortunately, I keep a sheet of paper in my owners manual with all the current settings I use and was able to quickly restore them.

The only complaint I have with this update is occasionally when I have the automatic notch on, I get a low level audio distorted noise with the receiver. It doesn't always happen and when it does, it happens so infrequently that it really isn't disturbing. I use the automatic notch most of the time when I use my Orion II as an IF for my VHF & UHF transverters. The Orion is a super IF setup for transverters.

73,
Bill/K1FPV

Good morning Bill. I am interested in your intermittent ANF distortion. On my Orion II (which I bought new), the ANF is totally unusable on SSB. The speech is totally garbled. While I suspect that ANF is primarily a CW function, my Yaesu FT 100 MP MK V does not distort on voice mode.

73, Andrew

Subject: [orion565] Re: Orion 2 front end overload

Good Morning!

I'm a bit surprised because, each time I've updated my Orion II's firmware, my memories get cleared out. I have to re-set them each time. After reading all the positive comments regarding the new update 2.044A, I updated my Orion II this weekend. Sure enough, My memories were wiped out along with all the menu settings. Fortunately, I keep a sheet of paper in my owners manual with all the current settings I use and was able to quickly restore them.

The only complaint I have with this update is occasionally when I have the automatic notch on, I get a low level audio distorted noise with the receiver. It doesn't always happen and when it does, it happens so infrequently that it really isn't disturbing. I use the automatic notch most of the time when I use my Orion II as an IF for my VHF & UHF transverters. The Orion is a super IF setup for transverters.

Hi Andrew,

Well, I get the noise with the distortion in both SSB and CW. I don't use it on CW (just tried it out for grins and giggles on CW), but when I monitor 50.125 mHz, I notice the noise and distortion come and go periodically. My transverters all use 28 mHz. as the IF. Unfortunately, there are a number of birdies that it gets rid of, but the periodic noise and distortion are aggravating.

I agree, when the AN is turned on to get rid of a carrier signal, it introduces a lot of distortion in the received SSB signal. This needs fixing as it is unusuable in it present condition.

I sent a not to ditsnbits and made a report, I am sure they are aware of this problem by now.

Thanks for the heads up, I was just getting ready to install however I use the AN all the time. This would be unacceptable and I would have to go right back to 2.039d. You've saved me valuable time!

On the other hand, the NR has been improved considerably in 44A!

So, choose you own poison!

I'm with you Toby. I like the new noise reduction...it is less tiring than the older one....but the AN does need fixing. I usually use the regular notch and tune it to the frequency of the offending heterodyne. There is no problem with the manual notch. Seeing you let Ten-Tec know on dits & bits, they know about it. Now we just have to wait for the updates fixing this issue.

I agree with all. I also use the manual notch and it works well. I see a vast improvement in the NR also. We are getting there!

73,

Andrew

I'm with you Toby. I like the new noise reduction...it is less tiring than the older one....but the AN does need fixing. I usually use the regular notch and tune it to the frequency of the offending heterodyne. There is no problem with the manual notch. Seeing you let Ten-Tec know on dits & bits, they know about it. Now we just have to wait for the updates fixing this issue.

John Henry, KI4JPL

I performed the update to my Orion-II, S/N: 06C10225, and it seams to work perfect so far, no issues doing the upgrade, and no issues after. Made over 200+ Qs, and I'm getting perfect transmit audio reports. Thanks for the updated.

Gentlemen,

I encountered a problem with one of my 565 Orions during Field Day this weekend. The main receiver lost reception on 80 meters. The other bands worked fine I did a master reset with no improvement. I then did a ROM clear followed by a master reset only to find all of the bands dead on the main receiver. The sub receiver still receives as usual. I put the second Orion in line, and it worked properly. Should I try to flash the firmware in the troublesome Orion, and will that make a difference, or does someone have another suggestion. Thanks in advance for any guidance.

I had the same problem with my Orion 565. It took several RAM and master resets, at least 5, to bring the main receiver back to life.

About 3 months ago, I sent the Orion to Tentec for that problem and new display. Of course, they could not duplicate the main receiver problem.

Try a reload of the software and a ram clear.

One of my irritations with TenTec service is that in my experience if you don't have a hard fault you will get a "no trouble found" even if the fault shows up frequently. I have experienced this many times over the many trips my Orion has made back to the mother ship. I recently had the 565 back for the "RIT cure." The RIT is ok so far, but having lived with this for years and over two Orions, I know not to count my chickens. To date, Jack told me they still have not seen a RIT fault in the repair shop. Since the problem with the 565 seems to be more like a 95% one than a 5% one, I am amazed-though I believe Jack. I think they simply cannot afford to try to track down such a will of the wisp which disappears with vibration, panel pressure, or any other possibly unrelated operation.

This time when the 565 went back I was also experiencing power instability-and had at increasing frequency. No trouble found. I suspect I will see the problem again-not a good one when you are driving an amp at 1500W. The Orion would jump from say 50w drive to 110W-nasty.

I have found that if you press along the curved area between the buttons and the display on the side starting with the menu button and the problem disappears, the problem is the oxidation of the connector mounted behind the buttons. That is how the signals are sent from the from panel to the CPU board. If the problem temporarily disappears when this is done, you need to use Deoxit cleaner and Deoxit protector on the pins and connector. I did that recently to my Orion and so far all is well. I will keep checking it. If no problems again for ten years, I know I found it! :-{

6149. 565 Orion Main Receiver Problem

Yahoo group: orion565 (2009 — 2013)
Date: 2010-06-28 22:25:14 UTC
From: Dean Cobussen
Topic: 6144 Message: 6149

I have experienced a "dead" radio with some kind of digital break-through.. slight popping in the speaker.. and quite a few times. But only on Version 2.063 - it tends to be when i play with the notch filter and or switching from AF to RF AGC and back.

While i have been working with Onno on the new blue LCD issues, (which has some minor contrast & heating problems) i have been operating on 1.372 and had none of this. I am sure 2.056 was fine also. I have done alot of swapping around with screen-work over weeks and weeks of trials and everytime i get this "dead" issue (with all lights on of course) it occurs with the version 2.063 only. However, these are the symptoms i have had and may not be related to this particular issue.

I would be safe to say, that what i am seeing with all this testing and experimenting, will be found in alot of radios. It is not a connector issue either, which was initially suggested to me. However, what your all talking about, may well be. Needless to say, I thought this was worth mentioning. Mine can be cured from multiple on/off attempts, which indicates a software lock up of some sort. However, as i said, i get none of this on 1.372 or 2.056.

Hope this is of use

regards,

Dean

I had some problems while using the 2.063 firmware and was told by Tentec when I called them I believe that this was a Beta version and I should use 2.062a. I switched back and have had no problems since. You might want to try this firmware version and see if it helps.

speaking of junk does anyone want to buy a 565 tuner and all filters with mic?
I can't stand this rig!!!! I wish I had my ft1000 mp back

6155. Front end overload again

Yahoo group: orion565 (2009 — 2013)
Date: 2010-07-07 15:45:55 UTC
From: tc423239
Topic: 6155 Message: 6155

I've tried master reset, ram clear several times....
using 2.044, slow agc, hang .21, decay 10 db, threshold 1.00
slope on 2.10, when i get a signal that is 50 to 60 over the front end overloads, and the audio is distorted....
if i set the slope to flat the audio is just fine....
anyone having this problem or do you have any suggestions...
thanks
Terry WD4OUM

Different firmware versions affect just how much RF gain is present, but having had several Orion I's and just about every firmware load available, my experience is that there is more RF gain available than you are ever going to need-and that if you do run it wide open you were going to be very unhappy with the results. One of the main complaints (noisy, distorted etc) by new users of the Orion I turned out to be due to the fact that you should not run the RF gain wide open.

Sorry, but the attitude that it should not be necessary to use RF Gain judiciously with modern dsp IF receivers is a BIG mistake based on my experience with the Orion v2 and K3. You'll never experience the amazing performance these rcvrs are capable of until you learn to use JUST enough RF Gain.

It's really not the RF gain that is the "problem", it is the digital AGC loop. You can solve the same "overload" problem by fiddling with the AGC settings. In fact, you were forced to do that in earlier versions of the firmware. Turning down the RF gain now adjusts the AGC threshold in a way that is like classical non-digital radios. The S meter level goes up as you reduce gain, to indicate where the AGC threshold is. It's a lot easier to use, for me at least.

The problem with reducing the RF gain is that you're losing the benefit of AGC to some extent. If the signal fades, your radio may get very quiet! Some AGC cushion is a good thing. Getting the right balance is an art. And it still pays to learn how to adjust the hang time and other AGC parameters.

From: Bob McGraw - K4TAX
Topic: 6155 Message: 6162

Lets face it, DSP systems of any type have a specific mathematical dynamic range expressed in dB. If this range is exceeded things basically go splat. I've found that correctly setting RF Gain depending on antenna and band conditions indeed does improve S/N ratio of the system. Let me make it clear, the front end of the receiver is not being overloaded, however it would appear that the AGC loop is being asked to control a signal that is greater than the dynamic range available. There's only so many digital bits in the algorithm of the system.

Many hams believe, incorrectly, that more gain is needed to hear weaker signals. To an extent this may be partly correct but only to the limit of the noise floor of the system. I recall the noise floor of the Orion is something like -132 dBm. This is basically a negative S unit value where S-0 is -127 dBm or 0.10 uV.

An example where the incoming noise/no signal is indicating S-8 on the meter. This represents a signal of -79 dBm or 25 uV at the antenna terminals. If the total dynamic range of the system is 127 dB then this S-8 noise level signal is sucking up 48 dB of the available 127 dB dynamic range. The solution is to reduce the gain of the system such as to restore the maximum available dynamic range. Keep in mind that the characteristics of the AGC system, i.e. the attack, release and threshold where AGC begins to take action is a large variable in this system, specifically the fact that there is the AGC that is internal to the DSP system and a separate AGC that is external to the DSP system.

I have found that adjusting RF Gain based on antenna efficiency and spectrum noise does optimize the receiver for the best signal to noise ratio and maintain maximum dynamic range at the same time. This will vary from band to band and antenna to antenna. But, once a value has been established for particular conditions then little change is required. Just let the AGC do its job of riding the gain.

Now enter the ATTN function. This reduces both the incoming desired signal and the offending noise the same amount. It does in effect reduce the likelihood of front end overload. A typical condition where ATTN is needed is more likely on 160M where a nearby BC station is present, their RF signal is picked up on the antenna and applied to the front end creating a condition where the front end is no longer linear and thus generates IM or spurious signals that can appear across or in the band. At this point I am speaking of signals in the order of 50,000 uV or -13 dBm. I personally do not like to use nor for that matter do I use the ATTN function as I do not have out of band signals at my QTH/antenna farm that produce that level of RF. I know, I've measured them with the HP analyzer.

Sounds like your solution is to reduce RF gain and make adjustments to the AGC threshold to minimize or eliminate your concerns.

Good point! Most NB systems can generate distortion in the audio where the threshold of blanking is exceeded.

Terry,
This still sounds very much like what I experienced with an Orion I when I was playing around with different firmware versions.

Have you tried a reset, ram clear and then reloading the firmware?

I have found on the Orion 1 with the latest beta, setting the AGC to slow, hang at .30, decay at 10, threshold at 1.00 and slope at 2:10 works fine on SSB (even with S-50+ sigs). Prog is set a little differently and is used for cw mostly (in my case).

There were several instances, when I had loaded a different firmware version, where the signals (esp strong SSB) sounded distorted. Doing the master reset, ram clear, then loading the firmware; immediately afterward, doing a master reset and ram clear again, and setting the AGC parameters seemed to keep this from happening.

You might even try a previous version of the firmware following this order and see how it does. If it works ok, do this again with 2.044. could be some combination of the firmware version you had and the update to 2.044 leaving a mem location at an odd value that the ram clear isn't handling.

If that doesn't help, I think I would consider a hardware issue. There aren't a huge number of headers in the Orion (thankfully), but you might want to open it up and re-seat anything you can (even the mini coax connections) and just visually check for things like swollen electrolytics. There is a basic level of the AGC system that is analog in nature, so there could be an issue there.

For sure check that the hardware NB is off, as has been mentioned.

6165. Installing an internal factory antenna tuner

Yahoo group: orion565 (2009 — 2013)

From: storygene
Topic: 6165 Message: 6165

I did not find that this has been covered anywhere before which surprises me but perhaps I was not using the correct key words in my Search string.

Can a TEN-TEC internal antenna tuner be purchased, and installed by myself into an Orion that does not have one in it now? Is this the same tuner that is used in the Orion II?

I was certain I saw the AT assembly available for sale from TEN-TEC for the Omni VII but I do not find it now and I do not think I have ever seen it listed for the Orion.

I am considering my options whether I should attempt to install a factory tuner or, other than my existisng high power manual tuner that is post-amp connected, buy an external AT.

I believe TT did offer the ATU as a separately installed option for a while on the Orion II. Then they stopped doing that, and I think the discussion at the time was that apparently there was not much of a market for it that way. LDG (who made the original Orion ATU) offered their ATU as a separately installed option for a while too, but they also stopped carrying it a short time later.

I don't think LDG discontinued it. I believe they supply the ATU to TenTec. I was lucky to purchase one from LDG before they stopped selling them. It was a direct drop-in with only one or two solder connections. It was a piece of cake and it did not void TenTec's warranty either.

Subject: Re: [orion565] Installing an internal factory antenna tuner

Gene,

I bought my O II with the ATU installed. I seem to remember that it had to be done at the factory, and not as a later add, but I may be wrong. I don't think Ten-Tec sells just the ATU as an accessory.

Subject: [orion565] Installing an internal factory antenna tuner

I did not find that this has been covered anywhere before which surprises me but perhaps I was not using the correct key words in my Search string.

Can a TEN-TEC internal antenna tuner be purchased, and installed by myself into an Orion that does not have one in it now? Is this the same tuner that is used in the Orion II?

I was certain I saw the AT assembly available for sale from TEN-TEC for the Omni VII but I do not find it now and I do not think I have ever seen it listed for the Orion.

I am considering my options whether I should attempt to install a factory tuner or, other than my existisng high power manual tuner that is post-amp connected, buy an external AT.

Gene / KI6SXW

Ten-Tec still sells the internal tuner. It is listed under kits in the drop down menu on their web site.

6170. Re: Front end overload again

Yahoo group: orion565 (2009 — 2013)
Date: 2010-07-09 07:24:25 UTC
From: pa1ap
Topic: 6155 Message: 6170

Playing with RF gain and threshold related settings certainly helps in many cases. But from what I found, many firmware versions show digital artifacts independent of RF gain setting. Reported this long time ago as in and out of band noise. 2063 adds significant plopping to the audio with quick rise time (like cw) on top of annoying artifacts. Audio examples included in the files section. I am looking forward to the new Orion 565 firmware!

Onno,

I can't get the Setup to work on my XP machine. The previous versions installed okay and I uninstalled them prior to trying this one but the Setup still gives me an error. The error says it has something to do with a go.microsoft.com link. Any ideas? Thanks...

Onno,

Problem was on my end. I use Firefox as my browser and my Internet Explorer was set to "Offline" for some reason. During the Setup, it was trying to download the file from Microsoft and it was hanging up because IE was set to Offline. I corrected that and the install went fine. Now to play...

Thanks...

Sorry for the inconvinience. Yes indeed since it is based on microsoft modules it will insist in using internet explorer to perform version check. I got another feedback on orion 2 where the s meter routine shows an error at first run and after that it works ok. I am investigating the timing right now. Best regards, Onno

Hello,

This email message is a notification to let you know that
a file has been uploaded to the Files area of the orion565
group.

File : /pa1ap AGC program/orion_agc_macro_v20050.zip
Uploaded by : pa1ap <pa1ap@...>
Description : AGC 2050: included firmware dependent S meter association. please check agc_profile_5.txt for details. This is important for the auto s meter function. When debug is enabled, you can now click on ?S and it will read the average s meter value and show its association. If it is not accurate you have to revise the firmware mapping (SET with SSET). I have checked the association for 1327 and 2056, both orion 565. If you can measure s meter values and find them different for other firmware, pse share

You can access this file at the URL:
http://groups.yahoo.com/group/orion565/files/pa1ap%20AGC%20program/orion_agc_macro_v20050.zip

From: pa1ap
Topic: 222 Message: 6178

To clarify the adjustments on AGC macro 2050 program:

1) The s meter window reads the s meter value (digital value) I learned orion firmware can use different values... For example, digital value 25 might mean S3 for 1372 and S6 for 2056....
2) Right now the program allowed you to choose firmware and associated Threshold and Rf Gain values (SET1, SET2 etc... Each set represents a firmware version.
3) I have included similar structure for the S meter value, called SSET1, SSET2 etc.... each set represents a firmware version and it relates to the SET row... In other words, SET1 refers to 1372 Threshold and RF Gain values and SSET1 refers to 1372 digital s meter values....
4) if you have a certain firmware (other then 1372 or 2056), connect a generator to orion, set it to S1 and write down the digital value. digital value can be retrieved through "prog", followed by enabling "debug" and then push ?S toolbar button... repeat this for each S meter value. Once finished, you can update the SSETx row within agc_profile_5.txt

I received couple of feedbacks and I have incorporated their findings. Should be no issue anymore for all reported issues.

If you do not use the s meter function, you dont have to do anything. Just use the program as before.

Enjoy and best regards,
Onno

Just had my TEN-TEC Orion 2 repaired and serviced by RIMARTON(AOR UK).
An absolutely spot on service this June.
The parts and service have now moved to Waters and Stanton .
Would anyone know of an alternative for any future repairs or parts tnx.

Well that's not the only group of ham radio folks closing. The 3 USA dealers that I do repair work for informed me that they are closing their business at the end of the month and thus will no longer need my service. These are Kenwood, ICOM and Yaesu dealers that have been in business for 15 plus years with one being a very significant exporter of ham radio products to South & Central America as well as islands of the Caribbean.

And with that, I'll cease doing ham radio repairs as well. Time for me to close shop and retire.

Business is tough everywhere.

Hello:
I am the owner of a nice Orion 565 clasic and I just can't seem to get the hang of what goes with the RF gain and the AGC. I also have a Omni VI plus and really like the rig and find that you just don't keep the RF gain up high, only just enough, and it works great on the omni. I do the same on the Orion and it still sounds noisy then I start to play with the AGC Program and get lost in what I trying to do??? Anyone help me out here even just a little. I think it is a good rig if I can only figure out how to use it. Frank KD7HVL

If you're running v2 firmware, you might want to try v1.373b5 firmware available at http://www.tentecwiki.org/doku.php?id=orionfw

The AGC settings are a lot less finicky in 1.372 and 1.373 versions. Just set threshold to a very low value (e.g. 1uV), set AF Gain to 50%, and set RF Gain to where you can just hear the band noise.

Greetings Frank,

You are not the only one...

With the Orion you get more then just slow/medium/fast on your AGC as well the unit is very sensitive...

The most likely reason for the rig to sound noisy is settings the AGC activation point (threshold) below the (band) noise. Threshold below band noise means that band noise will sound as loud as any other signal above threshold... in other words, undesired and desired have equal audio presence.

You could move the signal below threshold by reducing rf gain or increasing threshold. And when (band) noise is really high (like S5 or so) you might benefit from applying attenuation... Signals below threshold will not be equalized to 100% audio presence and hence your rig will sound a lot less noisier.

The challenges on Orion 565:

1) firmware release 1.x -> there is no visual indication of RF Gain and or Threshold values to help you determine if signals are below the threshold... You will have to observe the audio and listen until the audio drops.

2) firmware release 2.x -> visual indication is available, big help wqhen adjusting either rf gain or threshold

3) unreliable reference within all firmware on threshold and s meter readings... each firmware has its own value ranges, making it impossible to re-use a reference value from 1372 on 2065... totally different... So a cheat sheet made on release 1372 can be thrown away after an upgrade.

////
The AGC program is developed to help experimenting with the AGC and such like. First important element is the firmware dependency and this is addressed through the profile selection upper right toolbar scroll window (SET1, SET2 etc.)... Right now on Orion 565 SET1 (1372) and SET2 (2065) are well tested and work well.

Once connected, just observe the (band) noise indication on the main s meter (lets assume it reads S4) and click on the corresponding S meter button within the main window. In this case S4.. What it will do now is adjust RF Gain and Threshold to S4 values and the band noise should have less audio presence.. If not, just click on S5 to see what happens.

If you like to compare the adjusted values with normal behavior, just open the AGC buttons window and toggle between prog and med. This will allow you to quickly compare if it has any impact.

If you are using the matching firmware (1372 or 2065) you could also use the S meter window. Here you can click on Peak and after less then 2 seconds the AGC etc. would be

automatically set to match the conditions at that moment.

Hope this helps and the intention of the program was to make it easier to experiment. Bets regards, Onno

Yes, it is unfortunate Bob that many businesses are doing the same. I have a good friend here just a few miles away in NH who is no longer servicing amateur radio equipment either. The money just isn't there. I've repaired a few pieces of gear for close friends, but most of the time, specialized parts were tough to come by, a lot of guys now don't want to spend much $$$ to fix gear and the overall financial outlook is bleak. I'm glad I retired when I did!

6187. New poll for orion565

Yahoo group: orion565 (2009 — 2013)
Date: 2010-07-16 00:30:32 UTC
From: orion565@yahoogroups.com
Topic: 7 Message: 6187

Enter your vote today! A new poll has been created for the
orion565 group:

How many times did your Orion II require warranty repair?

o zero
o once
o twice
o three
o four or more

To vote, please visit the following web page:
http://groups.yahoo.com/group/orion565/surveys?id=13023912

Note: Please do not reply to this message. Poll votes are
not collected via email. To vote, you must go to the Yahoo! Groups
web site listed above.

Thanks!

6188. Monitor problem?

Yahoo group: orion565 (2009 — 2013)
Date: 2010-07-19 18:18:32 UTC
From: ve7tk
Topic: 6188 Message: 6188

I rarely use the MON function on my Orion (565) but decided to give it a try recently. Well it doesn't seem to be working the way it should. Here's the set-up:

1) firmware 1.373b5
2) MON level at 100%
3) SP (speech processor) off -- more on this.
4) earphones plugged in
5) Ten-Tec hand mic
6) No external Orion software involved

With this set-up I DO NOT hear the monitored signal in the earphones? I tried a different set of earphones and a different microphone. Still nothing.

Now IF I turn ON the SP at 6 I can hear the audio signal??

I have done a RAM CLEAR and MASTER RESET but nothing has changed. MON works well in RTTY (FSK) mode?

Is this a special feature of 1.373b5? I have tried firmware 2.xxx and it seems to function normally -- or more normally than 1.373b5. Thoughts appreciated!

Thanks.

With 1.373b5, I can clearly hear the MON with SP off. I'm not that familiar with the MON signal path, but I think it uses the subrx.

Thanks Barry. I have MAIN and SUB-RX in the earphones and the volume up on both. The MON level seems independent of both volume controls???

It's my understanding that the MON function is all in firmware. How it gets into the audio circuits for the speaker and earphones is a mystery. I sure haven't found anything in the schematics??

I'd be curious IF the Sub-RX is involved. As you know I've had the Sub-RX board out recently and maybe something is plugged into the wrong location? However, BOTH receivers are otherwise working perfectly.

All works as it should using firmware 2.063Xg.

So it looks like it's something going on between my Orion and 1.373b5? Since I rarely use the MON function on SSB I guess it can wait until the next release of firmware from the mother ship.

Well after loading Version 2.063Gx I went back to firmware 1.373b5. After another RAM CLEAR and MASTER RESET guess what.

The MON now works as designed?

I have no idea what happened BUT I'm happy the rig is back to normal and running my favourite firmware!

I've found judicial use of both, before and after (and a few times in between) does wonders when you play with firmware versions.

Having a station on the second floor of my house I have on rare occasions had problems with RF in the shack due to my windom being stretched over the top of my house. The Orion has been more susceptible than most rigs I have owned and I'd like to throw a question to the group. I quote the manual "Antenna type and its proximity to the station
are also factors in choosing ground methods. With good resonant antennas
located away from the station, the AC ground in your house wiring might be adequate" Does this suggest that a connection from the radio to a ground lug in the house wiring is acceptable and effective? Other suggestions??

Why not try counterpoise grounds in the shack - quarter wavelength stubs for the bands you operate connected to your chassis ground on the rig. I run a KW into a G5RV Jr just over the roof and have zero problems with RF getting into my Orion, so it's most likely that the RF is coming back on your ground line, if you're using one. I don't see how the AC ground is going to help this problem.

Tim

I can tell you what I have done and I have a shack on the second floor. This is not the best in terms of ground systems but then the science of good ground systems is as in depth as proper antenna systems. I have never had issues. All of my gear, 6 complete stations are all grounded together. I use RG8U running outside from the second floor, with the center conductor and the braid soldered together. This is then connected to one two10 foot copper ground rods which are then tired together, each is spaced 10 feet apart. They are tied together with RG8U with the center and ground braid again soldered together. I plan on adding an additional 10 foot copper ground rod in a triangle configuration to complete this ground system. The ground is also tied into the house AC ground. Again this set up has done the job but of course shorter runs of ground from he shack to the actual ground stakes would be better but like you I can only do what is attainable here.

Good luck 73 Tim

Tim,

The AC ground (green wire) is (generally) not a good RF ground. AC grounding is all about electrical safety -- being sure that an AC fault on your equipment (short to ground) will blow a fuse before it gets to you.

RF grounding is not that way. You want to put your equipment at "zero" potential relative to the infinite earth (whatever that is!). If your distance away from the earth is more than a small fraction (like 1/10) of a wavelength, you're not going to have a good RF ground, no matter what. Doesn't matter how many ground rods or how fat a cable you use!

You can sometimes "fool" your rig by providing a series-resonant (tuned) ground lead -- but that only works for a small range of frequencies.

It might be more effective if you could be sure that there is no antenna current flowing on the outside of your coax. That's often what gives you RF in the shack. Using a 1:1 "unun" transformer (choke) in your coax line is one way to go. You can also put ferrite toroids on all your rig connections - especially low-level lines like your mic cable.

Safety grounding against lightning is yet a whole other problem.

How did you tie into the house AC ground and why did you? I have never used any type of ground in 20 plus years in second story shacks. Is there a danger in using a banana plug and connecting the radio to just the ground plug in a wall three prong outlet?

Thanks Martin...I do have a current choke on the windom at the apex.
I'll try a few things here in the shack...the RF is just on a couple of
bands.

A choke at the rig might help, too.

Ok ...after a quick check I have some weird results. When I place the radio on 10 meters and disconnect the microphone (TT 708) the rig flashes lights all over the place(RF). When I plug the mic in it stops till my hand gets about 4 inches from the mic and it starts again. (I'm keying the rig with cw at 100 watts)

Duane's method is very effective for RF. I used the same technique when I was in an second story shack back in Alabama. For AC ground I ran a heavy copper strap to a nearby water pipe. To protect from lightning, I had outside connectors to unhook everything when not in use.

The Windom is an unbalanced antenna. Some type of RF choke or un-un, that is a unbalanced to unbalanced balun system, should be employed at the radio. This can be a series of beads on the coax or a flat winding of coax on a 3" or 4" dia form. About 25 to 30 ft is required for 160M with lesser amount, 20 to 25 ft, for 75M. I refer to this as the "ugly balun".

As to ground, a good RF ground must be very short and very low inductance. Generally not achievable when on the 2nd floor of a structure. RF in the shack being radiation from the antenna is being picked up on every lead connected to and from the radio. The solution here, and maybe not practical, is more space between the antenna and radio.

The 3rd pin safety ground should be used as intended and required. Do not consider this to be any form of RF ground. It isn't.

Do connect every piece of equipment in the station using the star ground method back to a common point. The power supply ground terminal is mine. I use #10 auto primary wire with lugs crimped and soldered on the ends as my ground jumpers. Do not daisy chain equipment.

Today's radios such as the Orion II have many wide band inputs. The faster we expect these radios to perform in terms of handling data, internally and externally, mean the inputs are more susceptible to RF. High speed data is more like RF, the higher the speed, the higher the frequency.

6207. VOX

Yahoo group: orion565 (2009 — 2013)
Date: 2010-07-20 22:28:21 UTC
From: mcelmer1
Topic: 1604 Message: 6207

I have an Orion with the Ten Tec headset/boom microphone. I am unable to find a Vox Trip Level setting that will work.

At 5 - 9% the VOX trips with the slightest movement. At 10% or a little higher the VOX "chops" the audio. I used Anti Vox settings from 0% to 40%; however, I don't have an Anti Vox issue with receiver audio tripping the the VOX.

Any suggestions?

W8TRN

Tim

I tied into the AC ground system because that is code and you do not want a different ground potential between your ham station and the AC ground so you ground all together. That is the station ground outside should be connected in some manner to the AC ground wiring. In this case I tied into the case for an outside air conditioner which of course is grounded via the house ground and AC wiring. The actual ground stake for the house was about 100 feet from the ham ground system.

RF ground and AC ground are two different things but your gear needs to be grounded. Very few hams have an " actual RF ground system" .

How did you tie into the house AC ground and why did you? I have never used any type of ground in 20 plus years in second story shacks. Is there a danger in using a banana plug and connecting the radio to just the ground plug in a wall three prong outlet?

6210. Re: [orion565] Grounding Question

Yahoo group: orion565 (2009 — 2013)
Date: 2010-07-21 00:06:56 UTC
From: Robert Mcgraw
Topic: 6197 Message: 6210

Any and all grounds should be bonded OUTSIDE of the structure.
Otherwise, one is inviting lighting energy into the structure. All
driven grounds must be tied together so as to minimize resistance between
them. Otherwise, during a nearby lightning strike as energy is
dissipated across the surface and though the earth, due to resistance
between the points, a step voltage will occur between the grounds. Any
equipment connected between any two grounds will be subject to this step
voltage. Damage is the most likely result.

Three grounds:
(a) AC mains or safety ground a.k.a 3rd pin ground. Should always be in
place for all equipment.

(b) Lightning ground, any and all efforts should be outside of the
structure, applied to all feed lines & rotor cables before they enter the
structure. Do not invite lightning into the structure.

(c) RF Ground, usually required for unbalanced antennas i.e. long wire,
sloper, off center fed Windom and etc. Not normally required for proper
matched coax fed antennas such as beams, dipoles with balun at feed point
etc. or antennas with a balanced feed system. Usually an extensive
array of buried radials with a common driven ground point. Must have
very short and low inductance between the RF source and its load.

6211. Flash Update

Yahoo group: orion565 (2009 — 2013)
Date: 2010-07-21 01:22:08 UTC
From: Sam
Topic: 6211 Message: 6211

I'm updating my ORION II with different firmware and very surprised at how slow it is. At approximately 2 minutes for each 10 lines of code to be written, and 10,700 lines of code, I am looking at hours and hours and hours (and hours) just to upgrade.

And if I don't like this version, it will take the same (plus or minus) amount of time to go back to another version ?

Wow! Is there a short cut or am I doing something wrong ? I'm following Ten-Tec's advice, using a USB to Serial cable and their "316" device driver for Windows 7. Also, probably can't quit halfway through as the radio would not have a complete set of instructions, and would just sit there and look stupid at me.

Thanks for any comments, and 73!

Sam,

I don't know what is wrong with your setup but, I am using XP Home
and a not very fast computer and it only take 3 or 4 minutes to install
any of the recent versions to my O II. I have even install 3 versions
in one evening checking out the features for comparison.

THANKS!
I do that in Bold as I am very thankful for the quick replies.
I quit update and began over, this time it's like before, except on steroids.
Finished in minutes.
I would have been an old(er) man when it finished the other way.

73,
Sam

Tim,

There is an excellent write up on RFI by K9YC at
http://www.audiosystemsgroup.com/RFI-Ham.pdf
The title is "A Ham's Guide to RFI, Ferrites, Baluns and Audio Interfacing".

In addition to discussing the various types of ground and RFI it talks about
the different
types of material used for chokes and baluns and which type is appropriate
at different
frequencies.

There is a wealth of knowledge here and well worth the time it takes to read
it.

6216. CAT command for DVR ?

Yahoo group: orion565 (2009 — 2013)
Date: 2010-07-24 13:15:22 UTC
From: f5jsd
Topic: 6216 Message: 6216

Good afternoon,

I am am using an Orion-2 with Win-Test contest logger program.
Win-Test has a feature allowing macro CAT commands to be assigned to Function keys.

This allows for instance to command Digital Voice Recorder messages from the K3 DVR module to be sent without touching the radio, only via the use of Win-Test.

I am wondering if there are any CAT commands in firmware 2.044A allowing the computer to send messages stored in O2 DVR memories. I could not find anything documented.

Any help appreciated.

73 de Pascal - F5JSD

6217. Lock-up in tune & CW mode Orion 566

Yahoo group: orion565 (2009 — 2013)
Date: 2010-07-24 16:04:06 UTC
From: w6hv@verizon.net
Topic: 6217 Message: 6217

Yesterday after a net on phone I was going to work some CW. As soon as I went to CW mode the Orion II went into full transmit and would not stop until I changed mode or turned the rig off. I tried to use the tune function and the same thing happened and it required turning off the rig to stop.

I tried a master reset twice, a RAM reset and then another master reset, and no luck. I reloaded the firmware and did a RAM and master reset again. The problem is still there. Of course it's the weekend and I can't call Ten-Tec. Any ideas as to what might work?

RF getting into the rig on a cable? Have you tried checking dummy load vs
antenna or different bands? How about reduced power?

Troy,

Do you have anything plugged into the back of the rig? Is the PTT button pushed down on your mike so you can use VOX and the PTT circuit is set to key on transmit? Just some food for thought. I'll do it over until the computer gets it right!

John,
I found the small stereo plug in the back key jack had shorted. I must have pulled my bug too much and created the short inside the plug. I cleared the short and all is now working.

I think my senior moments are getting longer! But, I wish T-T would use a standard stereo phone jack.

Thanks for the thoughts.

6221. Changing the RIT encoder

Yahoo group: orion565 (2009 — 2013)
Date: 2010-07-26 22:32:40 UTC
From: kzerofl
Topic: 6221 Message: 6221

Just discovered the RIT control on my new to me 565 doesn't work as it should. When pushed it will reset the RIT/XIT but when turned it only will shift 10hz +/-. The RIT works fine when the radio is used with computer control. I suspect the encoder needs replaced. How hard is it to replace this? I haven't taken the lid off to take a look yet but was wondering just how hard it is to do a replacement.

Yes I have tried the usual...master reset, reloading past and current firmware.

Topic: 6221 Message: 6223

I recently had my second 565 back at the mother ship for the RIT problem. I won't go into the long and boring details, but TT still had not had (at the time my unit went back) a unit display the symptom on the bench—which is a little amazing to me because the problem is apparently widespread in the 565—but it is often cured for a while by vibration—which occurs in shipment. Anyway, TT had concluded that with a high degree of probability the problem is a connector issue. Jack told me that they went to a new connector on the Orion II as a result. My unit went back around three months ago after having gotten into a RIT fail every fifteen minutes mode. So far there have been no failures since the unit came back. On the other hand, in olden days, after giving up on pulling the encoder knob, pressing the panel at appropriate places etc, folks did things like drop the front panel, resolder everything in sight, maybe change the encoder, etc. No matter what was done, it seemed to cure the problem for up to a year—then it returned. So my problem may be back at some point. Based on what Jack said though, I have hope that it is cured.

After one of Jack's friends contacted Jack and convinced him the problem was real, a document floated out from Paul Clinton on how to make the alleged repair. I don't think I have a copy, but someone on the reflector probably does. By make the repair I mean make the repair assuming it is the connector issue. There is also documentation someone may have on how to drop the panel and change the encoder, but the TT conclusion is (or was) that this is not an encoder issue. I think it cost me about $200 to have the repair done.

Good luck

There was quite a thread on the TT reflector a couple of years ago about this. Some could push or pull on the encoder and get it to work for a while, only to fail again later. Others did the resoldering you mentioned. But finally it was discovered that the connectors to the display board were not making good connection and simply removing (cleaning?) and replacing would make them good again for quite a while. So, all the encoder changes, apparently, were not really needed. Just the removal and reinstallation of the board (if it involved removing and replugging those cables) would do the trick. Best bet would be to go back in the TenTec reflector archives and look for this - probably "encoder" in the subject line would work. The discussion ran for quite a while.

Not likely the encoder, although replacing it may be a very expensive
way to fix the real culprit - bad connector. See this -

Thanks to everyone for the reply's. After researching the archives I tried one suggestion of pressing on the front panel. I pushed a couple of places and saw the RIT working some what. I then pushed hard between the main and the sub volume controls and it fixed the problem completely (temporarily I'm sure). It's a heck of a way to get things done....but it worked (for now)

6228. Orion II For Sale

Yahoo group: orion565 (2009 — 2013)
Date: 2010-07-27 03:34:56 UTC
From: David Yarnes
Topic: 2599 Message: 6228

I have a very nice Orion II for sale. It has the ATU installed, as well as all filters. This radio has been very lightly used, primarily because I now split my time between two locations, and the Orion is not a portable radio! So, I downsized to something that is portable, and the Orion II needs a better home! $3000.00 shipped to your U.S. address.

Tim,
A few months ago I had a problem with a bad mechanical encoder in my 565 (Bandwidth, had a dead spot). I decided that as long as I had to replace one of them, I would replace them all.

After replacing them, I tested them all to be sure they worked correctly.

Then a couple of weeks ago, I had reason to use the RIT control, and noticed the problem you (and others) have mentioned. I knew it wasn't a bad encoder (Or shouldn't be, since they were all replaced), so I opened the case, removed what I needed to, to get to the boards behind the front panel (if you check Ten-Tec's site and take a look at the V2 Logic Mod you can see how to do it). I pressed down on the encoder board near the header where it plugs onto the switch board socket. This fixed the problem.

Just thinking out loud, I wonder if it might be a matter of the strength of the contacts in the socket and a little aging of the contact surfaces in the socket and the mating pins. If it happens again on mine, I am thinking about using a very thin film of silver contact grease (CircuitWorks) to see if it permanently corrects the problem. It would have to be carefully applied to the header pins (Q-tip) and you'd have to be sure not to get it on anything else or across the socket surface, but I think it's worth a try.

Thanks for the info Anthony. I took a look at the TT web site and it looks fairly easy (but time consuming) process. I give it a shot when I get some time.

I experienced the very same symptoms with the RIT on my Orion after it came back from the factory with the V2 mod a few years ago. After working closely over the phone with Tony at Tentec to test parameters of the problem, effect of master reset and pressing on the front panel, etc., I sent the rig to the factory earlier this year. All of the connectors on the board behind the display were replaced. I don't recall the expense, but it was pretty nominal. I received the rig a week later and the RIT/XIT control has functioned properly ever since, with no failures. Based on this, it appears to me the factory has found the problem and can solve it with new connectors.

Those instructions came in very handy when I changed all of the encoders in mine. I think I posted some additional comments after it was completed (I know I did at the contesting.com Ten-Tec list, just not sure about here).

Changing them all is not for the faint of heart!!!

But if you do need to change one or more of them, there's nothing like good pictures from someone who has been there.

From: mcelmer1
Topic: 6234 Message: 6234

Does anyone have any comments about the 787? I'm very dissatisfied withe audio. Regardless of the settings on the Orion 1, the audio is either muffled or "unnatural" I have been informed that the 787 uses a different element that the 708 but that should not account for the poor audio.

One the other hand the 708 provides superior audio.

Comments, suggestions?

Topic: 6221 Message: 6236

This issue has returned on mine. Since I have a good dose of OCD, and can't stand not knowing why, I've been investigating this a bit.

Looking at the schematic, the circuit is very simple. They ground the encoder 'wiper' pin, and pull up the other two through 10k resistors (to 5v), then these go to another header through 100k resistors. It's the same for all of these encoders. I was wondering why they used 100k resistors, and note that these wind up going to what is basically an IO expander that is 3v. With such very low currents, it wouldn't take much to disrupt the pulses.

Something I did notice when reassembling the Orion after I replaced all the encoders, is that there is a very slight bow along the control board when the encoder in pressed into it's socket (I assume from the pressure of 24 pins being mechanically 'captive' to 24 socket connections). This might have caused a 'meeting' problem since the section of the header that the RIT encoder goes to is near the center of the string. There are 4, 6 pin sockets mounted end to end, not 1, 24 pin socket. Over time, with a slight alignment difference, the connection could get noisy.

First I will try cleaning the header pins and the sockets well, and applying some CircuitWorks CW7400 (cleaner/conditioner for gold/noble metal contacts). If this doesn't solve it completely, I will try CW7100, which is a conductive silver grease (not really grease in the strictest sense).

I will keep the list up to date on the results. It might be simpler to return it to Ten-Tec, but I just have to know why!!!

Anthony, K4ZNO

I note several emails and a few things that seemed to temporarily 'fix' this problem, but since it will drive me crazy until I figure it out, I am going to pursue it further.

It may not be fully resolvable without connector replacement, but I am going to see what can be done

I'm replying to my own post, so I guess I am kinda of talking to myself!

But, the more I look at the schematic, the more I wonder if the problem is actually at J15, after the 100k resistors. This is one of the sockets the logic board plugs into, with very long pins. I note that the picture of that board in the V2 mod doc shows non-gold plated pins. I don't remember if they are on mine or not. This would seem to be the most likely 'bad connection' point. It is also where the lowest current pulses would be.

This would explain why pressing on the face of the Orion near the Main AF control temporarily fixes the issue as well.

I am a bit surprised these pin are not gold plated, if the production Orion is the same way.

I will start there. If they are indeed not gold plated, silver conductive grease will be the first thing I try.

This is a serious issue causing the RIT problems. But our "SSB company" started to become known with extensive use of cheap parts (found at least in Orion 565):

- electrolytics caps
- fuse holder
- DC power input connector

Will be my next radio a Ten-Tec? Guess...

Hi Martin,
I know any company has to consider cost, but in this case, if these pins are tin plated and the sockets are gold plated, the combination is bound to have issues over time; especially considering the temperature fluxuations in this compartment. I think there is more heat here than in the PA!

These temp changes are bound to cause minute movement of the pins in the connectors, causing some tin disposits on the gold contacts
and oxidation (which is harder than tin to tin oxides, so it's harder to break up). I read one test where a tin to gold contact had 1 milliohm resistance, and 20 mins later, after slight movement in a controled environment, it had 1 ohm. Imagine what would happen in a few months.

I think this is one area where long term reliability should have been considered above cost.
Given more time, I suspect there would be issues with more of the encoders.
I've not seen any pictures of the logic board from an Orion II, but I wonder if it has gold plated pins?

Yes, I agree, gold against tin is not typically a preferable combination from my experience. As to cost issues, I have not found any of these described issues with my Omni VII. It uses basically the same connectors, headers, ribbons and such. Although it may be that the original Orion may have used other brands or types of connectors.

While I don't have an Orion or Orion II to examine at present, it may be that the current/voltage across the connector is not adequate to allow "punch through" of any oxidation. {Gold oxidizes too.} The 100K build-out R's many need to be lowered in value to increase the current/voltage issue if this is the case.

Experience says that temp changes does cause movement of the connectors and headers. At the same time heating does typically increase oxidation based on the local environment. Sometimes a good engineering decision or a good accounting financial decision turns out to be a long term reliability issue.

Bob,
For sure 100k is surprising; in the microamp range at most, so pretty much no 'wiping current' at all.

I looked at the Orion II schematic and see they have the same resistor values, but I suspect they went to gold pins. Still, some oxide would form, as you mentioned, but probably would take a very long time compared to tin-gold.

I also looked at the schematic for the Omni VII, and note they use 470 ohm resistors with similar encoders. That's a lot more reasonable!

I can't find anything specific to adding silver into the mix (with a lubricant). I did find that a lubricant usual extends the time the connection continues to 'connect', and that silver-tin is not too bad as long as it's not in a harsh environment, but nothing about tin, silver (with lubricant) and gold.

I will try it and see if it takes care of the issue. Still, over time, I'm sure the pins will need to be 'exercised' to break up and oxidation that builds up.

Supposedly this CircuitWorks concoction is very temp stable and doesn't dry out, so hopefully it will extend the life of the connections to the EOF of the transceiver. It's not inexpensive ($27 for .25 oz), but would be worth it to stop this once and for all! I'm still waiting for it to be shipped from Allied.

We shall see!

Decreasing the R values my increase current and reduce or eliminate the issue, however, it may increase zipper noise from the rotary encoders. The Omni VII has a very small amount of zipper noise under certain conditions. It is not objectionable in my usage and findings.

There are very few commercial contact cleaners and lubricants and "contact renew" concoctions that I trust. A clean lint free cloth and pure surgical grade isopropyl alcohol are my favorites for cleaning contacts. I did use Cramolin for a few years with success however, least amount used is best and more has been shown to create serious problems. Even the original 5% solution I found to be excessive and risky. I think the EPA concluded the stuff is dangerous and it has all but disappeared from the market or is under a different name and formulation, Deoxit. I have a 4 oz bottle, 100% concentration, of the RED and the BLUE. Based on the dilution I use, 1:1000, that quantity should last me at least 150 years and resulting in lots of controls and contacts cleaned.

From: mrniceguyisme2003
Topic: 6243 Message: 6243

Hi, Ive just bought a Orion2,I take delivery within a week,however it was initially purchased from the retailer about 4 to 5 months ago. Im not sure what firmware version it will have, and am wondering if I should update it upon arrival or leave it as is, as I heard that there is some issues with the latest update?
I havent read the manual yet either, however Il see if i can download a manual, so that as soon as it arrives, i can get it on air asap. Does anyone have any start up advice on any initial settings or procedure before I plug it in and start playing? (comes with all filters,ATU,and pwr supply/spkr,extra fan). And I plan to run it as an exciter for SPE Expert Amp,so i guess i need to arrange appropriate cables?
I also have a Yaesu MD100 desk mic,8 pin, which I hope to use. Is this compatable? Any settings suggestions?
Thanks for any advice.

Hi Richard. Welcome to the Ozone. I too wondered about upgrading and it got to the point where I had to try, just to see what the newer versions were like. After trying the newest version, plus the beta downloads, I went back to 2.039d. They just don't have it right yet (IMO).

As far as the microphone, just make sure the audio ground and radio ground wires are separate and the mic should work fine. Sometimes you will run into an issue where someone has tied those two wires together, either at the mic side or at the 8 prong plug. If they are soldered together, separate them and do it right.

Also, check out T*T's YouTube site for lots of instructional video clips.

From my microphone to the antenna, I now have a 100% USA station (Heil, W2IHY, Ten-Tec, RF Concepts (alpha), Palstar, Ameritron, Dentron, Drake, Heathkit, Astron, etc...). Enough of the Japanese crap!

73,
Sam

thank for the info Sam. Judging by the eham reviews, the Regal mic seems to
be highly recommended.
Anyone with any opinions? I have a particular interest in good quality audio
but also effective for dx under not so perfect conditions.
Im thinking 200hz to 2900 may be a good tx setting ?

I use the Heil Goldline Pro mic, which sounds excellent (so I've been told) on SSB. I use that with the W2IHY 8band EQ and Noise Gate and the W2IHY EQplus. That gives me full hi-fi SSB audio, and when I want that DX sound, I just crank the Bass down and turn the

Treble up.

The W2IHY equipment can make even a $1 Radio Shack project microphone sound like a $500 studio mic, so that is good place to start. The reason I'm using the Heil is that I got it 10+ years ago with my IC756pro. I just had to rewire it for the Yaesu / ORION configuration. Another reason I'm using Heil is because it is American made.

If you need my settings of the W2IHY equipment, just send me an email once you get the
piece(s).

OK, Sam -

I have the Heil mic and stand (all made for TenTec) and the 8-band W2IHY Eq and Noise Gate.

I would appreciate know which settings you enjoy most for DX, and also for rag-chewing. I am also going to try the mic and Eq on my IC-781 - just recently purchased, so the settings might come in hand for that set-up, too.   { Of course I will have to wire some adaptor cables to be able to go back and fourth between the two radios. }

Thanks es 73,

Jim, K8OZ

Sam,Sounds like youve got a gr8 audio set up. What dsp frequency response bandwidth do u operate on ssb, particularly for dx. Im thinking 200hz to 2900hz may be a good starting point for me. How long have u had your Orion2 for? any issues of any sort?
cheers

Sam,Sounds like youve got a gr8 audio set up. What dsp frequency response bandwidth do u operate on ssb, particularly for dx. Im thinking 200hz to 2900hz may be a good starting point for me. How long have u had your Orion2 for? any issues of any sort?
cheers

From: Sam W. Jacobs, C.E.T.
Topic: 6243 Message: 6251

The reply I made, directly posting my settings didn't turn out so good so I uploaded the WORD document to the file area. It's in .wps format. This is "general" settings using the ORION and the W2IHY audio gear. Your settings most likely will be different, however this will get you started.

73,
Sam
K3SAM

Subject: Re: [orion565] firmware upgrade or not? New user.

OK, Sam -

I have the Heil mic and stand (all made for TenTec) and the 8-band W2IHY Eq and Noise Gate.

I would appreciate know which settings you enjoy most for DX, and also for rag-chewing. I am also going to try the mic and Eq on my IC-781 - just recently purchased, so the settings might come in hand for that set-up, too. { Of course I will have to wire some adaptor cables to be able to go back and fourth between the two radios. }

Thanks es 73,

Jim, K8OZ

I use the Heil Goldline Pro mic, which sounds excellent (so I've been told) on SSB. I use that with the W2IHY 8band EQ and Noise Gate and the W2IHY EQplus. That gives me full hi-fi SSB audio, and when I want that DX sound, I just crank the Bass down and turn the

Treble up.

The W2IHY equipment can make even a $1 Radio Shack project microphone sound like

a $500 studio mic, so that is good place to start. The reason I'm using the Heil is that I got it 10+ years ago with my IC756pro. I just had to rewire it

for the Yaesu / ORION configuration. Another reason I'm using Heil is because it is American made.

If you need my settings of the W2IHY equipment, just send me an email once you get the
piece(s).

73,
Sam

thank for the info Sam. Judging by the eham reviews, the Regal mic seems to be highly recommended.
Anyone with any opinions? I have a particular interest in good quality audio but also effective for dx under not so perfect conditions.
Im thinking 200hz to 2900 may be a good tx setting ?

6252. Orion RIT Issue - A fix I HOPE

Yahoo group: orion565 (2009 — 2013)
Date: 2010-08-06 23:03:17 UTC
From: Anthony
Topic: 6252 Message: 6252

I finally received the conductive silver grease.

I found that the pins from the logic board to the front panel sockets are indeed tin plated. Luckily the sockets are too (or not so luckily) but in that environment and with no wiping current, tin is not such a good thing.

I applied the grease (a little tedious but not too bad). I will document it and post it as soon as I see if it's consistent.

The grease seems to be about the same consistency as white clay with plenty of moisture (thicker than I imagined), but this is a good thing: it will stay put, just a little more difficult to work with.

6253. TenTec Items FS

Yahoo group: orion565 (2009 — 2013)
Date: 2010-08-06 23:33:53 UTC
From: Ken Simpson, W8EK
Topic: 6253 Message: 6253

TenTec and related Items For Sale:

HF Transceiver, Antenna Tuners, Interface, Tuning Pod, Wattmeters, Power Supplies, Microphone, and more

TenTec 585 Paragon HF Transceiver:

The Paragon is a top of the line transceiver that includes a general coverage receiver. It covers 160-10 meters, including WARC bands, with 100 watts output. The receiver is fantastic. It has dual VFOs and many memories built in, along with a speech processor. Basically, it has about every feature that a ham could want in an HF rig.

This particular unit works 100% as best I can tell. Since the rig does so many things, I am sure that there is something I didn't test, but I don't know what it is (or I would have tested it!). It has had all updates completed by TenTec.

Cosmetically, it is in extremely nice shape. The front panel is extremely good. Most all of the lettering is clean and crisp. This one also has the Giehl chip in it making it similar to a Paragon II.

Large manual and power cord included for $650.

TenTec 238 Roller Inductor Antenna Tuner:

This HF antenna tuner will handle the full legal limit, and will match almost anything. It is rated to match loads up to 3000 ohms.
TenTec
It is an "L" network, which means that there is only one correct matching point, and not false readings like some tuners. It has a roller inductor that permits matching all HF bands, including the WARC bands.

In addition to the tuner, it also includes a wattmeter with 200 and 2000 watt scales, plus SWR bridge. There is also an antenna switch built in, so this unit will handle all of your antenna needs.

This particular unit works fine, and looks extremely nice. I can not find a scratch or defect on it. With paper work for $395.

MFJ 949 E Antenna Tuner

The MFJ-949E deluxe 300 watt Versa Tuner II gives you full coverage from 1.8 to 30 MHz, with a peak and average reading cross-needle

SWR/power meter. It features a custom designed inductor switch, 1000 volt tuning capacitors, Teflon insulation washers and proper L/C ratio to ensure arc-free operation with up to 300 Watts. MFJ's Cross-Needle Meter shows you SWR, forward and reflected power simultaneously. It reads both peak and average power on 300 or 30 watt ranges. A dummy load is built in. It includes an antenna switch for the two coaxial cables and one random wire or balanced line, in addition to the dummy load. It needs 12 V DC to illuminate the meter.

This is the current model that MFJ is selling. This particular unit works fine, and looks close to new. With paper work for $125.

TenTec Model 258 RS-232 interface board w/258-IBM Software
This accessory will add a computer interface to TenTec HF transceivers. I know for sure it works with the 585 Paragon, and my memory says it also works with the Omni V, and I think the Omni VI, although I think certain interations of the Omni VI included it as standard. It consists of a plug in board, plus cabling to a DB-25 connector.
In addition to the hardware, I also have the software, for use on a standard PC.
It is in good shape and works fine.
$135 for both the hardware and software

TenTec 301 "Tuning Pod"
This unit can be used with an Omni V and Omni VI, and I think most of the TenTec rigs that use an optical encoder. It permits one to tune the rig from a semi-remote location. This one works fine and looks very close to new. With paper work for $125.

TenTec 288, 1800 Hz filter
1800 hz for wide CW, narrow SSB or digital use
Fits Corsairs, Paragons, Omni V and VI, and others.
It looks like new, with paperwork. $75

MFJ 815 B Cross Needle Wattmeter:

The MFJ-815B cross-needle meter allows you to monitor both forward and reflected power, and SWR simultaneously. There are buttons to select either Peak or Average reading and power ranges of 200/2000 watts forward and 50/500 watts reflected. Frequency coverage is 1.8 to 60 MHz, so it covers 6 meters in addition to the HF bands, making it ideal for some of the new rigs that include 6 meters.
The peak reading function of this meter and meter light require external 12 V DC.

This particular unit works fine, and looks very close to new. With paper work for $65.

MFJ 815 (not the B model) similar to above.
It works fine, and looks good. With paper work for $50.

TenTec Power Supplies:

TenTec 961 power supply with speaker
Produces 20+ amps at 13.8 Volts DC.
This supply matches the Corsair II, Paragon, and Omni V/VI series.
A nice speaker is included. This particular unit works 100% and
looks very good. Paper work is included for $150.

TenTec Model 280 power supply, 20 amps at 13 V DC
This supply is quite heavy duty electrically. It has 2 pass
transistors, instead of the one that some have. It also has an
ammeter on it.
This one works fine, and looks OK as well.
A previous owner removed the molded in TenTec power
cable on the back and added very heavy binding posts,
so that it can be used with many different rigs and
not just TenTec. It also has a couple RCA jacks for
lower power use.
With paper work for $100.

"Switcher / 25" 25 amp switching power supply:
This is a 25 amp switching power supply in a case that
matches the early Omni series case, with the metal bezel
around it. It is in a case that is the same size as a 243
remote VFO. It has an ammeter on the front, along with
Switch, TenTec logo, and output bulb. The front panel
basically looks like a 280 power supply with a metal bezel,
but says "Switcher/25" on it. It is very quiet, and well
shielded, and does not produce any electrical noise that
I could find. $150

TenTec 705 desk microphone
This electret desk mic has the 4 pin connector, with PTT and
"hold" buttons. It works great, and looks like new.
With paper work for $75.

Prices do not include shipping from Florida.

Thanks.

TenTec and related Items For Sale:

HF Transceiver, Antenna Tuners, Interface, Tuning Pod, Wattmeters,

Power Supplies, Microphone, and more

TenTec 585 Paragon HF Transceiver:

The Paragon is a top of the line transceiver that includes a

general coverage receiver. It covers 160-10 meters, including

WARC bands, with 100 watts output. The receiver is fantastic.

It has dual VFOs and many memories built in, along with a

speech processor. Basically, it has about every feature that

a ham could want in an HF rig.

This particular unit works 100% as best I can tell. Since the

rig does so many things, I am sure that there is something I

didn't test, but I don't know what it is (or I would have

tested it!). It has had all updates completed by TenTec.

Cosmetically, it is in extremely nice shape. The front panel

is extremely good. Most all of the lettering is clean and

crisp. This one also has the Giehl chip in it making it

similar to a Paragon II.

Large manual and power cord included for $650.

TenTec 238 Roller Inductor Antenna Tuner:

This HF antenna tuner will handle the full legal limit, and will match almost anything. It is rated to match loads up to 3000 ohms.

TenTec

It is an "L" network, which means that there is only one correct matching point, and not false readings like some tuners. It has a roller inductor that permits matching all HF bands, including the WARC bands.

In addition to the tuner, it also includes a wattmeter with 200 and 2000 watt scales, plus SWR bridge. There is also an antenna switch built in, so this unit will handle all of your antenna needs.

This particular unit works fine, and looks extremely nice. I can not find a scratch or defect on it. With paper work for $395.

MFJ 949 E Antenna Tuner

The MFJ-949E deluxe 300 watt Versa Tuner II gives you full coverage from 1.8 to 30 MHz, with a peak and average reading cross-needle SWR/power meter. It features a custom designed inductor switch, 1000 volt tuning capacitors, Teflon insulation washers and proper L/C ratio to ensure arc-free operation with up to 300 Watts. MFJ's Cross-Needle Meter shows you SWR, forward and reflected power simultaneously. It reads both peak and average power on 300 or 30 watt ranges. A dummy load is built in. It includes an antenna switch for the two coaxial cables and one random wire or balanced line, in addition to the dummy load. It needs 12 V DC to illuminate the meter.

This is the current model that MFJ is selling. This particular unit works fine, and looks close to new. With paper work for $125.

TenTec Model 258 RS-232 interface board w/258-IBM Software

This accessory will add a computer interface to TenTec HF

transceivers. I know for sure it works with the 585 Paragon, and my memory says it also works with the Omni V, and I think the Omni VI, although I think certain interations of the Omni VI included it as standard. It consists of a plug in board, plus cabling to a DB-25 connector.

In addition to the hardware, I also have the software, for use on a standard PC.

It is in good shape and works fine.

$135 for both the hardware and software

TenTec 301 "Tuning Pod"

This unit can be used with an Omni V and Omni VI, and I think most of the TenTec rigs that use an optical encoder. It permits one to tune the rig from a semi-remote location. This one works fine and looks very close to new. With paper work for $125.

TenTec 288, 1800 Hz filter

1800 hz for wide CW, narrow SSB or digital use

Fits Corsairs, Paragons, Omni V and VI, and others.

It looks like new, with paperwork. $75

MFJ 815 B Cross Needle Wattmeter:

The MFJ-815B cross-needle meter allows you to monitor both forward and reflected power, and SWR simultaneously. There are buttons to select either Peak or Average reading and power ranges of 200/2000 watts forward and 50/500 watts reflected. Frequency coverage is 1.8 to 60 MHz, so it covers 6 meters in addition to the HF bands, making it ideal for some of the new rigs that include 6 meters.

The peak reading function of this meter and meter light require external 12 V DC.

This particular unit works fine, and looks very close to new.

With paper work for $65.

MFJ 815 (not the B model) similar to above.

It works fine, and looks good. With paper work for $50.

TenTec Power Supplies:

TenTec 961 power supply with speaker

Produces 20+ amps at 13.8 Volts DC.

This supply matches the Corsair II, Paragon, and Omni V/VI series.

A nice speaker is included. This particular unit works 100% and

looks very good. Paper work is included for $150.

TenTec Model 280 power supply, 20 amps at 13 V DC

This supply is quite heavy duty electrically. It has 2 pass

transistors, instead of the one that some have. It also has an

ammeter on it.

This one works fine, and looks OK as well.

A previous owner removed the molded in TenTec power

cable on the back and added very heavy binding posts,

so that it can be used with many different rigs and

not just TenTec. It also has a couple RCA jacks for

lower power use.

With paper work for $100.

"Switcher / 25" 25 amp switching power supply:

This is a 25 amp switching power supply in a case that

matches the early Omni series case, with the metal bezel

around it. It is in a case that is the same size as a 243

remote VFO. It has an ammeter on the front, along with

Switch, TenTec logo, and output bulb. The front panel

basically looks like a 280 power supply with a metal bezel,

but says "Switcher/25" on it. It is very quiet, and well

shielded, and does not produce any electrical noise that

I could find. $150

TenTec 705 desk microphone

This electret desk mic has the 4 pin connector, with PTT and

"hold" buttons. It works great, and looks like new.

With paper work for $75.

Prices do not include shipping from Florida.

Thanks.

I'm on 75 meters most early mornings, 3.933 in the Black Sheep Lounge and monitor 3.805 in the afternoons when I'm in. I can go to any band (including 160) at almost any time if you wish to set up a test. Just let me know.

I'd like to hear the radio with that mike and those processor settings.

When and what bands/freq do you operate?

One of the Tentec mikes such as the 709 and the Orion and proper mike
technique is all that is needed to get great sounding audio.

Topic: 6243 Message: 6258

My take on this. Since one has 100 watts, then the transmit bandwidth becomes important. One could spread the 100 watts over 2800 Hz or so or one could spread it over 1500 Hz or so. This is about equal to adding some 3 dB of power. From a speech recognition and intelligibility point of view, look at your typical receiver band width. In a pile up situation likely about 1500 Hz is all one uses. Then look at RX bandwidth vs. PBT freq. That says in my case about 1500 Hz shifted about 300 Hz so the effective bandwidth on RX is closer to 1200 Hz. So my thinking is to pack as much energy as possible into the range of say 400 Hz to about 1800 Hz for a bandwidth of 1400 Hz. That typically fits nicely with the receiver bandwidth on the other end. Speech processing adds an increase to average level but be careful and not hit the ALC to heavy or distortion would likely result and the folks on either side of your signal won't be too happy.

For SSB rag chew I open things up to sound nice. For DX pile up bustin' I narrow the transmit bandwidth and push up the speech processor a bit. The radio does the work.

From: Sam W. Jacobs, C.E.T.
Topic: 6243 Message: 6259

The reason I commented in the first place is because I am not into DX or bustin' a big pile-up, I ragchew with friends who for the most part are running Hi-Fi audio and most of our receivers are cracked open to at least 3000hz.

The W2IHY equipment that we use adds tons of volume to our signal, and most of the time we don't care about getting the most out of our 100 watts, as our radios are running at about 25 watts, being used as exciters for our legal limit amplifiers.

Just the rest of my 2 cents.

73,
Sam
K3SAM

6262. Re: Handmike wiring info for Orion II

Yahoo group: orion565 (2009 — 2013)
Date: 2010-05-12 21:45:34 UTC
From: k1fpv
Topic: 6050 Message: 6262

If you didn't give Ten-Tec a call, the hand mic that Ten-Tec used was a small electret mic. I wired my hand mic that came with my 526 for the 8 pin connector. I have another that came with my Argo V. I isolated my chasis ground and mic ground with caps....though ultimately they wind up in the same place....this avoided any ground loups and makes for nice clean audio.

If you have trouble figuring it out, I'll try to draw it on a schematic and scan it for you fo that I can email it.

73,
Bill/K1FPV

>
> Hand mic doesn't come with one new? Wow, that's strange all by itself. Well this is a TenTec hand mic at least. I checked the manual on how a mic "should" be wired, but of course it doesn't have anything on the hand mic itself and what is what. I opened the mic up and was totally confused by the wiring inside to the push button. I tried a few combinations without any luck.

6263. Possible Swap Jupiter for Omni VII/ Orion 565 ??

Yahoo group: orion565 (2009 — 2013)
Date: 2010-08-09 20:37:33 UTC
From: NZ8J
Topic: 6263 Message: 6263

I recently purchased a used Ten Tec Jupiter 538 (it has an 2004 serial number) and I am so pleased with it's operation that I would like to have a few more features and try to work out a swap for an Omni VII/AT or possibly an Orion 565/AT.

The Jupiter is a gray cabinet/green screen with the new chip in it adding the new CW functions. It also has a Ten Tec tuner installed. The condition is a 9.5, excellent condition, screen is perfect and it works as new.

I would like to swap with someone who has a Omni VII/AT or Orion 565/AT and who might want something a little simpler and cheaper in it's place and recover some cash in the process.

I have the manual and power cord, I do not have the original box, but it would be very well packed for shipment. It is from a non smoking environment.

I also have the Ten Tec 706 Microphone and Ten Tec 1208 6 Meter Transverter that can go with it if necessary.

If you have what I am looking for and would like to trade please email off list to nz8j@... with details of your radio (year of manufacture, options, etc) and how much difference you would require to swap. It must also be from a non smoking environment.

I do not want to sell the Jupiter outright at this time.

Thanks for looking
Tim

6264. Re: Orion RIT Issue - A fix I HOPE

Yahoo group: orion565 (2009 — 2013)
Date: 2010-08-09 20:50:08 UTC
From: Anthony
Topic: 6252 Message: 6264

Just an update:

RIT is still working. It had been very unstable until this was done. I have had the Orion on for many hours and off for many hours, testing every time it crossed my mind (which has been often). I even turn it on for long enough to test when I walk by it, if its off.

I really suspect fretting of the tin contacts as the cause of most of the RIT issues. Doing anything that moved the connection a little (or alot) would temporarily fix it, but didn't address the real cause. It just so happens the RIT connection was mostly affected (maybe some combination of the location of the pins, the sockets, the mounting of the 'layers' of boards, etc). The way encoders are read by the processor, only one pin need have a problem and it could stop working (depending on how the programmer decided to handle errors). Hard to tell without seeing the source (which will probably never happen). There could even be an interrupt priority/timing situation in the control program that made it worse with the RIT encoder (these go to an IO expander, with lots of IO to deal with, so I can see the possibility).

It is my hope that the silver grease will prevent this from reoccurring.

Ultimately, time will tell.

I consider the use of tin and the lack of any 'wiping' current to be a real engineering faux pas, but one that was probably precipitated by an ill conceived cost savings measure.

I would really like to know if the Orion II has gold plated pins/sockets.

Please note that the subject line says "A Fix". I know better than to assume I have all the answers to anything!!!

I've begun documenting the procedure (which is very simple, its just good to have a list of needed materials and such before you start). After a little more testing, I'll complete it and add it to the files section.

6267. 715 RF Speech Processor & RFI

Yahoo group: orion565 (2009 — 2013)
Date: 2010-08-10 01:39:27 UTC
From: Bob McGraw - K4TAX
Topic: 6267 Message: 6267

Recent inquiry about mike wiring on one of the groups prompted me to investigate a recent RFI issue with the 715 RF Speech Processor. I also noted on eham.net that 2 or 3 posted reviews of the product indicated some RFI issues. All seemed to blame the cable between the 715 processor and the radio.

The original wiring configuration of the 1/4" TRS plug to the 8 pin plug is as follows:
Tip to pin 8 - this is MIC audio +
Ring to pin 6 - this is PTT
Sleeve to pin 5 via the blue wire
Sleeve to pin 7 via the shield

My correction to the problem was simply to reverse the shield originally on pin 7 and move it to pin 5.
The blue wire on pin 5 was moved to pin 7.

The solution was tried using the 709A mike and the 707 mike with equal results.being no RFI issue.

For those that need it, here is the 8 pin wiring:
Pin #1 = NC
Pin #2 = +10VDC
Pin #3 = NC
Pin #4 = NC
Pin #5 = GRD
Pin #6 = PTT
Pin #7 = MIC GRD
Pin #8 = MIC audio

The original wiring configuration of the 1/4" TRS plug to the 8 pin plug is as follows:
Tip to pin 8 - this is MIC audio +
Ring to pin 6 - this is PTT
Sleeve to pin 5 via the blue wire
Sleeve to pin 7 via the shield

My correction to the problem was simply to reverse the shield originally on pin 7 and move it to pin 5.
The blue wire on pin 5 was moved to pin 7.

The solution was tried using the 709A mike and the 707 mike with equal results.being no RFI issue.

For those that need it, here is the 8 pin wiring:
Pin #1 = NC
Pin #2 = +10VDC
Pin #3 = NC
Pin #4 = NC
Pin #5 = GRD
Pin #6 = PTT
Pin #7 = MIC GRD
Pin #8 = MIC audio

Subject: 715 RF Speech Processor & RFI

Recent inquiry about mike wiring on one of the groups prompted me to investigate a recent RFI issue with the 715 RF Speech Processor. I also noted on eham.net that 2 or 3 posted reviews of the product indicated some RFI issues. All seemed to blame the cable between the 715 processor and the radio.

The original wiring configuration of the 1/4" TRS plug to the 8 pin plug is as follows:
Tip to pin 8 - this is MIC audio +
Ring to pin 6 - this is PTT
Sleeve to pin 5 via the blue wire
Sleeve to pin 7 via the shield

My correction to the problem was simply to reverse the shield originally on pin 7 and move it to pin 5.
The blue wire on pin 5 was moved to pin 7.

The solution was tried using the 709A mike and the 707 mike with equal results.being no RFI issue.

6271. rf and rx distortion -Help pls

Yahoo group: orion565 (2009 — 2013)
Date: 2010-08-10 22:44:04 UTC
From: MSport 325
Topic: 6271 Message: 6271

Just unpacked my near new Orion2.
Admittedly Im still reading the manual, and have had a little play around with some of the adjustments to try and rectify.
Compared to my many previous other brand radios, Receive seems distorted. It helps if i dont use any NB or NR, but still not as smooth as what Im used to. Sensitivity is good, but just the quality of receice audio is not quite right.
Also , Ive tried 2 yaesu mics,as i believe ots the same wiring, taken from my 1000mkV, and after a few adjustments, i was getting good reports on 40m using a dipole. Then moved to 20m with a triband yagi, and now getting reports of poor audio with RF. I also notice I can hear on tx , some rf coming through the tentec speaker(which is built in to the pwr supply). When I disconnect the speaker, the built in spkr in the radio is fine, but still getting rf on tx audio.
Spoke to a Australian Orion dealer, he has suggested getting the tentec desk mic.
All equipment is earthed/grounded, and all other radios work fine.
please any suggestions /advice would be welcome.

6272. Filter trade? #217 for #218 or #2018

Yahoo group: orion565 (2009 — 2013)

From: Anthony
Topic: 6272 Message: 6272

I know this is a long shot, but I though I'd ask in case.

I have a newer #217 500hz filter (has both leads of the input and output caps soldered on the PC board rather than one lead soldered to the pin) that I don't need and would like to find a #218 1.8 khz filter (preferably later vintage as well) or even the 2018 (newer replacement for the 218). Anyone up for a trade??

I tested the 217 in my Orion a few days ago and it works fine. I have a 400hz Inrad in that position and don't use the 217.

6274. Orion 565 For Sale - w/blue screen & accessories

Yahoo group: orion565 (2009 — 2013)
Date: 2010-08-12 03:16:11 UTC
From: deancobussen
Topic: 6274 Message: 6274

Hi all, i have enjoyed being part of the Orion group and using the 565 for the past few years. I am moving on and the rig is for sale. I have:

565 Rig - with a new blue screen and internal fan modifications.
307B - Ext Speaker
708A - Desk Mic
302R - Remote/Encoder keypad
OHL15 - Orion-to-HL-1.5 Band Data/Tokyo Amp band switching cable/interface

No PSU. Rig has some minor normal scratching on the cover but face looks good. Will ship in NZ or to Australia. I don't know if its worth sending any further since they are essentially cheaper in the USA anyway.

If you want to know more please email me outside the forum and we can discuss price.

regards,

Dean
ZL1COB

Hi,
new to group and just have a question.
How can i have a waterfall on my o2?
I'm running fw 2.044A and dsp 2.10B110
but do not have a SWEEP DISPLAY OPTION spectrum/waterfall
but simple SWEEP RANGE --HZ.
What i miss?
Thanks a lot,

Date: 2010-08-15 12:11:11 UTC
From: WB1DX
Topic: 6278 Message: 6280

Hi Kirby,

You're second in line right now. I should know by this afternoon if it is sold or not. This unit does not have the ATU installed.

Here are some details in the mean time:

My cell number is 508-341-6544.

Trying to anticipate your questions, and perhaps not being at the radio this afternoon, here's some additional information:

* I have the original boxes.

* It was purchased new for $4536 in Mar 2008. Serial number is: 08C10147

* I had it serviced 3 mos after purchase, Aug of '08 for low sub-receiver audio. They replaced a logic board and it has been fine ever since. No problems, no issues. Everything works fantastic.

* I have the 2.041XT firmware loaded.

* I have the original "goodie bag" with all connectors, plus, fuses, etc.

* I drove an ACOM 1000 with it, so the finals have never seen more than 50 watts maximum.

* There are no modifications, alterations, hacks, or any other work performed on this radio.

* I am a YCCC contest club member and participate heavily in the ARRL and CQWW contests. The radio performs awesome in heavy band-crowded conditions.

* I get GREAT audio reports all the time, using nothing more than the radio and a Heil Pro-20 microphone.

The reason I am selling is I need to simplify, my availability will be very limited in the next few years. Until recently, I used the radio nearly every day, just listening, working DX, or playing in contests. But having a fairly large contest type station does not make sense for me right now and probably for the next 5-6 years. So, I will downsize the station for now and not feel guilty about having all this equipment that I really can't use.

I hope I touched on everything. If you know anything about Ten Tec radios, you know that this is a fantastic rig. You will not be disappointed.

I do have 1 in front of you and 1 behind you in queue. I will get back to you either way, sometime today most likely.

73, Ken

Tim,

You must have read it after I corrected the errors!

It's amazing how many times you look over something, think it's fine, then read it AFTER posting it somewhere and see glaring things you missed the last 100 times you read it! And the sad thing is there are still a couple (mostly letters left out).

I wish that grease came in a little packet like CPU thermal grease does. You need so little of it, the syringe is almost like a quart bottle, comparatively speaking.

This may be my last post here--at least for awhile! I've sold my Orion II, and now I don't have a Ten-Tec rig on the operating table for the first time in 30 years! So, I'm dropping out from this group, but I do wish all you Orion owners the very best. It's a great radio, but just wasn't quite what I needed at this stage of the game.

I do have to say that I was just a bit disappointed in the way that Ten-Tec has handled the Orion series. Although the company has great tech support, they really didn't have very good support for the radio, given its capabilities. I won't dwell on that--you either agree or disagree, and there is no sense starting up a back and forth controversy about all of that. I'll just say that I was able to achieve more of my personal preferences with a different radio.

The Ten-Tec folks are a great bunch, and hopefully one of these days I will be again looking at one of their fine products. Actually, I still have a few older Ten-Tec radios, albeit older models, so I'm still a fan!

In about a week I'll put in the "unsubscribe" message, but in the meantime, I can't resist watching to see if anyone gets really excited about something new from Ten-Tec support. The Orions are great radios, and deserve some real attention by the company to make them really perform. You all need to keep the pressure up to make them do that!

Dave W7AQK

6287. 566 Frequent loss of main and/or sub audio at power on

Yahoo group: orion565 (2009 — 2013)
Date: 2010-08-21 21:54:41 UTC
From: Robert
Topic: 6287 Message: 6287

I have a feeling this one is going to mean sending the girl back to Ten-Tec, but I thought I'd give this a shot first. I have an Orion II with 2.044 firmware, but I had this problem on the previous version (2.039) also. Often, when I power on the radio, I will get no audio (other than some hiss) on the main Rx or the sub Rx, or sometimes both. Cycling power on the radio 1 - 3 times generally fixes it. Performing a complete reset will also fix it, but the problem will just return within a day or two.

Often while powering up, the radio will get to the point after the logo screen and just before you hear a relay kick in, and the radio will appear to reset itself and perform the entire power-on sequence again. I have seen it do this as many as 4 times before the radio completes powering up.

Once the radio gets in a "stable" state (i.e., audio on both receivers works), it will function perfectly until after I turn it off, then turn it back on (generally 8 - 24 hours later).

Any ideas would be greatly appreciated. By the way, the Orion has the tuner and all roofing filters installed, but no other modifications (other than the occasional firmware updates). The radio has been exhibiting this behavior for roughly the last 1 - 2 months (pretty much after Field Day -- go figure).

Thanks in advance and 73,

Bob WA4FOM

6288. Regal 707 mic settings

From: mrniceguyisme2003
Topic: 6288 Message: 6288

The mic settings that were provided on the instruction sheet were way off in my opinion. I had to yell in the mic to get decent audio output.
A friend helped me on air to adjust settings, and now I get complimentary reports. Its been set up for general rag chew:
3000hz, low cut off 80hz ,mic gain 50, h/w mic gain 13 or 14, SP 3.
Anyone try out this setting and let me know you results...or if u have any other suggestions.
By the way, i was getting rf with a Yaesu desk mic i tried , with the Regal...no probs

Two things that I would look at Bob, First is the power supply. That's from the PS unit to the radio including the fuse holder.

The second is a reload of the firmware. I understand you just went from .039d to .044x however everything you are describing seems to be either an issue of the firmware, or the radio being starved for current (thus where a bad fuse holder might come into play).

Just my 2 cents. Good luck.

I switched firmware from .039 to the latest version and noticed immediately that the audio was distorted which included pops and clicks. Just as quickly I moved back to .039d. My one and only gripe with T*T is that their software development is not nearly where it should be.

I just wish their software development team was a strong as their service (#1) department. I can't compliment them enough there. If you haven't checked out their YouTube videos, they are also all nicely produced and informative.

Well actually, im still undecided...and wondering if some Orion2 users can advise me as to what exactly is the benefit/features of the new firmware upgrade.

There have been some reported issues of caps going bad on the power distribution board. I think TT is aware of this and has sent either replacement caps or done a board exchange. Talk to Paul. It might save some shipping and the board swap is an easy fix.

Two things that I would look at Bob, First is the power supply. That's from the PS unit to the radio including the fuse holder.

The second is a reload of the firmware. I understand you just went from .039d to .044x however everything you are describing seems to be either an issue of the firmware, or the radio being starved for current (thus where a bad fuse holder might come into play).

Just my 2 cents. Good luck.

Subject: [orion565] 566 Frequent loss of main and/or sub audio at power on

I have a feeling this one is going to mean sending the girl back to Ten-Tec, but I thought I'd give this a shot first. I have an Orion II with 2.044 firmware, but I had this problem on the previous version (2.039) also. Often, when I power on the radio, I will get no audio (other than some hiss) on the main Rx or the sub Rx, or sometimes both. Cycling power on the radio 1 - 3 times generally fixes it. Performing a complete reset will also fix it, but the problem will just return within a day or two.

Often while powering up, the radio will get to the point after the logo screen and just before you hear a relay kick in, and the radio will appear to reset itself and perform the entire power-on sequence again. I have seen it do this as many as 4 times before the radio completes powering up.

Once the radio gets in a "stable" state (i.e., audio on both receivers works), it will function perfectly until after I turn it off, then turn it back on (generally 8 - 24 hours later).

Any ideas would be greatly appreciated. By the way, the Orion has the tuner and all roofing filters installed, but no other modifications (other than the occasional firmware updates). The radio has been exhibiting this behavior for roughly the last 1 - 2 months (pretty much after Field Day -- go figure).

Thanks in advance and 73,

Bob WA4FOM

I have had 2 A9 boards (power distribution boards) go bad, right outside of warranty and T*T has made good on both. They are not just sending out the caps in advance, so you should take a look at your board to see if there are any bulges or leakage.

When this board goes down the radio will not turn on. You will get faint lighting from the LED's and meter. So if you don't want any radio down time you might want to do some preventative maintenance. A board swap is quick and easy, component replacement is also easy if you know how to solder.

6293. 566 Frequent loss of main and/or sub audio at power on

Yahoo group: orion565 (2009 — 2013)
Date: 2010-08-22 14:20:53 UTC
From: Anthony Bowyer
Topic: 6287 Message: 6293

I don't have a 566 (565 here) but, as mentioned previously, this sounds very much like the issues caused by bad electrolytic capacitors on the power supply board (A9). When I first got the Orion I have, I replaced them with better one's, just in case.

N6IE has information on this issue at his website:

www.N6IE.com

These caps are easy to replace, since the board is small and can be removed easily,
but it does take more heat for the negative lead going thru the ground plane.

I had to use a 100 watt gun (the ground plane is substantial). You just have to

take care with 100 watts.

Bob

Just wanted to let you know your not alone. My Orion II with firmware 2.043b has started doing the same thing in the last 2-3 months.

Thanks for the post and the follow ups from Sam and Bob

It would be interesting to know the age of these radios. There's 2 or 3 recent and different posts that are described having this problem.

I bet there is a common issue with component aging or failure. Most likely related to a date code on the specific batch of components. In the world of electronics, this is not an unusual failure condition. It just needs to be isolated and corrected as likely an entire production batch may have the same issues.

I've seen it before, once fixed always fixed, so it is no long term concern.

If you are referring to the capacitors failing on the A9 board Bob, the replacement T*T sent me about 6 months ago failed and they had to send me another one. This is a current problem. My original board failed and the purchase date was 06/23/08, S/N #08C11217, purchased new.

All the caps appear to be the same manufacture, so perhaps they (as I would) purchased a large lot and part, if not all of that lot is leaky or just poorly made. You can't blame Ten-Tec for this, in fact they have gone out of their way to correct someone elses problem.

Yes, I'm aware of some issues that appear to be batch related. And I agree, and don't fault Tentec, for they have supplied replacements to address the fault. As I've said before "new does not guarantee good, only new".

This could be an issue where the original or replacement caps are 85 degree C rated components when they should be 105 degree C components. That makes a difference, specially where they are used in power supply circuits.

6298. 565 Power Setting?

Yahoo group: orion565 (2009 — 2013)
Date: 2010-08-23 13:49:58 UTC
From: wb2rhm
Topic: 6298 Message: 6298

All,

How does the 'power level' setting work in the 565?

When the ptt is activated, does the output power start at 0 watts and
increase to the set value, with the set value representing a 'wall'
that the power does not exceed?

Or does the power briefly start at
100% and then throttle back to the set value?

The meter seems to have a quick 'overshoot' when the signal is started,

Thanks, 73,
Ben - WB2RHM

6299. Re: 566 Frequent loss of main and/or sub audio at power on

Thanks much to everyone for their replies. As they say, there
is some comfort in knowing someone else has seen this problem.
My Spidey Sennse told me it was either some insidious (i.e.,
weird) long-standing firmware bug or a power supply issue.

I'm going to have a look at the schematic and open up the Orion
and see if I can spot anything obvious. I'm pretty handy with
a soldering iron and I have a small one for small jobs and a
gun that has always taken care of the more stubborn cases...

In either case, I'm going to have a go at contacting Ten-Tec.
I really love this radio; this problem I classify of more of
an annoyance than anything else...

Thanks again and 73,

Bob WA4FOM

I found it depends on the firmware on your 565. Do you know the firmware number? When rig is running, press and keep pressing the meny button for 10 seconds or so and you would get the ten tec welcome screen providing the firmware number...

In release 1 you might see the power indicator to fluctuate up and down when running constant carrier... In other words, the power is not consistent (even on external pwr meter this is visible). In release 2, yes sometimes the needled almost breaks by the overshoot, especially when running cw...Funny enough the digital values between release 1 and 2 vary significantly as well. Release two has higher resolution (almost double) and since the s meter is driven by an 8 bit? DA converter this could explain the rough indications...

It might be my rig being unique though. Perhaps others have different findings.

Best regards,
Onno

I'm replying to my own post again... Humm..

Anyway, I cleaned up the doc a bit (it was driving me crazy) and copied it to the Files section. I left the previous version in case.

Onno,

I am using 2.062a firmware.

I have a bird wattmeter, but it does not give me the capability to 'see/record' the actual PEAK output power during "PTT" time.

I am asking about it because, even though I have the Orion power setting set at a relatively low number, I am having the finals in my amp getting fried (MRF-150 MOSFETS 4x$40ea) on occasion during RTTY contests (~100% duty cycle).

The service folks at Ameritron keep telling me that the only way that could be happening is from having too high a level of input power going into the amp, BUT that the power level setting I have on the Orion should be OK.... if that is all that is being sent to the amp (and no power spikes are happening).... hence my question.

thanks, 73,

Ben - WB2RHM

PS I have a 'blue screen' orion 565 and I am using your thermister solution in it (taped to the top center on the rear of the display unit) and it is working just fine at keeping the contrast 'stable', Thanks.

My question "what is the input power" to the amp? "Should be OK" may not be good enough. Although Ameritron states that exceeding 100 watts for an extended period of time can cause component failure, I doubt that the Orion is exceeding 100 watts. But at the same time, overdrive will eat the devices. Worse if excessive temperature due to 100% duty cycle modes and inadequate cooling conditions exist.

If this is the ALS-600 amp then the RTTY duty cycle is 50%. Thus power out should be limited to 350 watts max with a 10 minute transmit time followed by an equal receive time. With the optional high volume fan, the amp the power out can be increased to 500 watts with a duty cycle of 2 minutes transmit, 1 minute off. With standard cooling the amp should not be operated at above 200 watts or 25 watts reflected power which ever is greater.

The Orion PTT waveform is the same as the CW waveform, thus rise and fall times. The power starts at 0 and reaches the power set value in the CW rise time value. Usually this is approximately 3 ms to 10 ms depending on operator selected parameters. Spikes or surges should not be an issue. If there is concerns, then a scope across the coax between the exciter and the amp, with the scope triggered from the PTT circuit will show the waveform and any resultants spikes.

Bob,

Yes, I am using an Ameritron ALS-600S, but with the recommended high volume fan installed from day one. I monitor the case temperature and it never exceeds 85 degrees F, even during an all weekend RTTY contest.

I have been using a 565 power setting of 18 - 23, depending on band to 'ensure' that the amp power out is at or less than 350 watts.

The random FET-Fry has occurred with a 'cold' amp and with a 'warm' amp. Ameritron says 'everything' points to too much input power getting to the FETS rather than they are overcooking.

Then I saw this article in QST http://www.ad5x.com/images/Articles/HiPwr%20Pad%20RevA.pdf so I wondered out-loud 'how does the 565 do it?'

Something else I need to look into is how my 565 is being put into transmit.... I RTTY contest using N1MM and the Aux Input connector to use FSK mode. I'm not sure whether the PTT line is being used or a 'transmit' command is sent over the serial interface.

Thanks, 73,

Ben - WB2RHM

Sounds like you are doing everything correctly. Great on the high volume fan!

Since the radio is a 100 watt rated radio and Ameritron says the amp is suitably driven with a 100 watt radio, I too wonder what's taking place. Specially if you have the output tamed down to 18 to 23 watts and the output power is 350 watts or less. I'm sure you have a good match on the antenna but there is a reflected power limit on the ALS-600. It's 25 watts as I recall.

Looking at the coax level between the transceiver and the amp might just be worthwhile.

Thanks for the feedback.

Ben -

The ALS-600 protection circuit shuts the amp down if it sees 75 watts reflected. That is according to the internal SWR bridge and assumes it is correctly calibrated. Mine wasn't until after I replaced a few finals and rooted out the cause.

Good luck.

I have had to replace the finals in both of the ALS-600 amps that I have owned. I have proved that the protection circuit is not foolproof.
So far, I have been unable to damage the AL-80B; but still trying.

The last time I updated my Orion I is some years ago.
Remember you had to start an update utility on your PC.

Expected the utility to be on rfsquared.com, but can't find it.

Can someone point me to the place where I can download the update utility?

Thanks!

Paul van Dam, PA7UL

Troy,

Thanks for that pointer!
The files on that site are .RUF files and are the firmware files you have to upload.
I am looking for the update software that you have to run on your PC.

Any idea where I can find that software?

Paul van Dam

6318. Orion 565 contrast saturation

Yahoo group: orion565 (2009 — 2013)
Date: 2010-09-06 20:07:47 UTC
From: pa1ap
Topic: 6318 Message: 6318

Greetings,

I have been running a small modification since last Saturday which significantly reduced the long term contrast saturation, as well addressed the cold to warm transition.

This applies to the new blue lcd screen and so far so good:-)

Essentially, following the manufactor specification the logic voltage can vary between 2.7V and 5.5 Volt DC. Since the new blue LCD has a flat cable connecting to the logic board it was straight forward to cut the 5 Volt logic power line on the lcd connector and insert two diodes in between. The two diodes reduce the voltage to the lcd logic with 1.2 volt, resulting in 3.8 V dc.

Since the modification the lcd screen improved on a couple of things;

1) cold to warm is not noticable anymore
2) long term contrast issue after two days running did not show as much as it did before. It does do a little but certainly something I can accept
3) the lcd screen itselve does not heat up anymore as much as it did before
4) the difference between blue on white and white on blue became much smaller. I can now switch both modes without much adjusting, where before i had to change the contrast settings using the potentiometer.

It might work for the original LCD too, but I did not verify this. This would also require a modification on the lcd pcb since you would have to cut the 5 volt supply and insert the diodes.

Perhaps other users experience the same contrast issue on their old/new lcd and this modification seems to do a good job reducing the problem.

Thanks and best regards,
Onno , pa1ap

6319. 565 audio output level ?

Yahoo group: orion565 (2009 — 2013)
Date: 2010-09-08 11:16:19 UTC
From: Martin Sole
Topic: 6319 Message: 6319

I am trying to understand if my Orion has a problem or not. Ever since I have had the radio I have been less than impressed by the amount of audio that comes out of either the internal or external speaker. I don't believe it is a sensitivity issue. According to the signal generator there is all the sensitivity that the specification states, rather this is purely audio output level. Are there any known issues with failing audio on the Orion?

I need the AF gain set way over half in almost all conditions and if the RF gain is backed off slightly or the AGC threshold raised then the AF gain needs to be pretty much flat out and it's still not exactly loud! The manual says the line out is a nominal 0dbm into 600 ohms, I haven't measured mine yet but will do this evening. It certainly sounds a lot less and is hardly able to drive most external devices that other radios have no difficulty with. Even straight into a sound card it does not overload with the MIC gain at max and the MIC boost turned on.

So, anybody else seen reduced audio? Any likely capacitor problems?

TIA

Martin, HS0ZED

A bit more.

A quick test with a sig gen. Actually an IFR 2945A CSM.

Input a carrier to give a signal at S9. Look at the audio from the LINE OUT socket measures approx. -30dBm! Measure same signal at the AUXOUT DIN socket gives about -22dBm!

Interestingly the spot tone produces the same level when set to about 5. The spot tone at 100 produces about -5.5dBm!

Anybody spot anything?

Thanks

if you connect a headphone, do you have to turn up the volume as much as well? Or does the headphone work as designed? The headphone and speaker use different audio paths. I am turning up the volume to about 1/3 to get loud audio from the speakers. at 50% it becomes to loud to bare.

Another thought; did you connect an audio interface to the orion audio out plug? if so, does it include a decouple capacitor to block the (faulty) dc voltage on the audio pin? Peter, oz1pif reported (and confirmed by TT) that the audio out has 5V dc on the audio pin causing issue when an audio transformer is connected. That might also impact the audio output.

Thanks Onno,

I didn't know about the 5 volts on the Aux out but looking at the circuit it is obvious.

Where does the LINE OUT connection come from? Is it AUXOUT_MAIN. This would also have 5 volts on it if the schematic is correct (Same circuit as AUX OUT - LEFT and AUX OUT - RIGHT). Measuring these with a voltmeter I see no DC volts!

I had the problem of losing audio to the speaker after about 30-45 minutes of operation. The headphone audio was always fine.

Tentec service replaced a couple of electrolytics in the speaker audio out chain. Everything is OK now.

Martin,

I also have noticed the same problem with the audio out from both speaker (internal or external) and the headphone jack. The volume level in either case does not get to the point where it's unbearable even at full volume. I have always considered the audio output of the Orion, at least mine, to be rather weak. I have had my Orion since 2003 and it's always been this way. I'm glad I'm not the only one who thought this. I would like to know why. I'll still keep it though.

6325. Orion 566 extra signals!!

Yahoo group: orion565 (2009 — 2013)
Date: 2010-09-09 05:49:17 UTC
From: Ross
Topic: 6325 Message: 6325

I have an odd problem, that I have not noticed before, while checking PSK signals (and other digital modes) on 14.070 or there abouts,
I can see and decode the main signal perfectly, using any of the normal software, (HRD Mixw etc) but I now have what could be called
extra signals twice the width of the main signal approx 1000hz and and down the band ie above and below the main signal.
These extra signals dont decode.
I can see this on PSK and RTTY, so it is not likely to be overdriving of the various transmitters.

Can someone enlighten me, has my Orion got itself a fault, or is it a menu setting somewhere?

Thanks

Hi Ross,

I have ocassionally noticed the same on my Orion II when using PSK31 and my SignaLink USB. If I reduce the audio drive from the signalink, it goes away. The extra signals are not as strong as the main signal. I suspect it is overdriving something in the chain of equipment. I get the same effect with both MixW 2.19 and DigiPan 2.0 on my end.

Topic: 6319 Message: 6328

First, we typically don't use dBm values these days. In professional audio we don't use terminated 600 ohm loads either thus the dBm measurement value is somewhat in error and largely outdated. Devices today are designed to be voltage sources and are typically not truly capable of driving a 600 ohm load. Now with that said, perhaps a dBv unit of measure is more likely correct. Most consumer devices have an input impedance of 10K ohms or greater and are thus accepted as line input devices with levels in the -20 dBv range. If one is using a true dBm measurement then the correct values attained are likely 3 to 6 dB higher.

The audio output to the speaker should be about 2.5 watts with less than 3% THD+n into a 8 ohm load. Measure that value. You'll either get a "no problem" or a issue where it is not delivering correct audio power output.

As to speakers, I find the internal speaker is firing upwards and in my case is directly into an overhead shelf. With the radio on the bail the speaker is actually firing into the rear of the shelf and inadequate SPL is coming forward in my finding. Thus my reason for using a good communications speaker sitting on top of the radio and aimed at my head. That works and gets loud. At the same time Hi-Fi type speakers are typically very inefficient and require large amounts to power to make a decent SPL value.

I'd first suspect overdrive of the computer input causing a very distorted signal, not capable of correct decoding.

Yes, all too common is that the interface is overdriving the input on the computer. Even though the level can be controlled by the Windows Mixer, if the input is overdriven, the fader being after the fact, reducing the level does not correct the issue. The solution is to reduce the level from the interface device and increase the level at the Windows Mixer.

Subject: [orion565] Re: Orion 566 extra signals!!

Hi Ross,

I have ocassionally noticed the same on my Orion II when using PSK31 and my SignaLink USB. If I reduce the audio drive from the signalink, it goes away. The extra signals are not as strong as the main signal. I suspect it is overdriving something in the chain of equipment. I get the same effect with both MixW 2.19 and DigiPan 2.0 on my end.

73,
Bill/K1FPV

I replaced the three capacitors on the A9 board (less
than $5 solution!) and the Orion has been purring
along peacefully since. Oddly, the capacitors did
NOT show any signs of wear (i.e., bulging) as others
have noticed. I replaced them anyway, and everything
looks A-OK here.

Thanks again to all!

On Orion 566 it is a known design error that there is 5VDC on the audio out pins... Connect a voltmeter and you will see... The DC voltage can saturate the transformer in your psk interface and hence distortion will occur. Peter OZ1pif reported this a couple of months ago and TT confirmed the issue. Recommended cure: include a capacitor to decouple the dc voltage.

One common failure mode of electrolytic caps is a decrease in capacitive value. I have seen and checked many electrolytics, old ones, that measure 5% to 20% of their stated value. Hence, a 100 mf nominal value cap when measured on a bridge shows a capacitive value to be 5 to 25 mf. These do not show any sign of swelling or bulging and show a high value of resistance between terminal. Typically the decrease in value is caused by elevated temperature causing the electrolyte to evaporate or dry and thus the capacitive value decreases. This among others is a good reason to use 105 degree C rated caps when replacing old 85 degree C rated devices. This is specially true in power supply filter circuits.

A second cause of value change is reverse polarization of a capacitor. Typically a polarized capacitor is used as a coupling capacitor in an audio circuit on the output of a op amp. A very minor drift of the offset of the op amp device can cause a reverse polarity of only a few millivolts to be applied to the cap. Over time the value of the cap decreases to a very small percentage of the original value. A better solution is to use a non-polarized replacement.

6336. Orion565 sweep function

Yahoo group: orion565 (2009 — 2013)
Date: 2010-09-14 22:59:24 UTC
From: n4uc_2
Topic: 6336 Message: 6336

I just installed 2.063Xg and notice that a sweep function on/off selector has been added in the RX menu. This is in addition to the original button on the side of the display screen. Their operation appears to resemble that of a 3-way light switch. Is there a reason for having two switches to turn the sweep on and off? The one in the RX menu replaced the sweep frequency width selector which I would rather have instead of 2 on/off switches.

Are 2.062 and 2.063 the only firmware versions available for download on the internet? I'd like to try some of the interim versions to see if I could get rid of some/all of the DSP popping in the audio.

If running release 2 firmware I would recommend 2.056.

http://www.tentecwiki.org/doku.php?id=orionfw#version_2

Very good sound and stable performance. Versions higher have poor AGC implementation with all kind of dsp artifacts. Some version have artifacts independent of signal strength and some (like 2063xg) when there is a strong signal with quick risetime (aka cw). It seems when the signal moves from digital to analog AGC, signal falls in between so to say. Almost like AGC off for a moment in time. Suggested 2063xg "solution" is to turn down RF gain and hence avoid AGC to operate and/or switch to AF AGC mode which helps a little...

I think we are all very eager for the New Henry firmware to be released for orion 565!

http://www.tentecwiki.org/doku.php?id=orionfw#version_2

Very good sound and stable performance. Versions higher have poor AGC implementation with all kind of dsp artifacts. Some version have artifacts independent of signal strength and some (like 2063xg) when there is a strong signal with quick risetime (aka cw). It seems when the signal moves from digital to analog AGC, signal falls in between so to say. Almost like AGC off for a moment in time. Suggested 2063xg "solution" is to turn down RF gain and hence avoid AGC to operate and/or switch to AF AGC mode which helps a little...

I think we are all very eager for the New Henry firmware to be released for orion 565!

Their operation appears to resemble that of a 3-way light switch. Is there a reason for having two switches to turn the sweep on and off? The one in the RX menu replaced the sweep frequency width selector which I would rather have instead of 2 on/off switches.

Just realized 2.057 would be good too. starting 2058 they messed up the agc function. Anyway, play with it to see how it goes. 2057 will give you clean audio. Voice recording is not working as designed though using this version.

6340. Orion 9MHz IF Mod - Update

Yahoo group: orion565 (2009 — 2013)
Date: 2010-09-18 15:31:33 UTC
From: Rick W
Topic: 6340 Message: 6340

Roberto, EB4EQA, has recently done the 9MHz IF modification to a friend's Orion (565). During the modification, he took some detailed photos and has provided some excellent construction hints. I have included a link in the documentation currently on my website. Here is a direct link to Roberto's site:

www.rbarrios.com/projects/ORION

Thank you Roberto for sharing!
73,
Rick

6341. startup

Yahoo group: orion565 (2009 — 2013)
Date: 2010-09-22 15:16:01 UTC
From: kengarg
Topic: 6341 Message: 6341

Folks,
I have been noticing an issue during the startup of the 565 radio. I wanted to see if anyone else has seen this one.
When I start the radio and if I am on 20m, the radio after bootup will not exactly be locked on 20m. (dont know where it is receiving) I would usually switch to 40m and come back to 20m, then I would get proper receive on 20m. This only happens during startup on 20m. If I startup on 40m, the issue doesnt seem to be there.
I am using the latest beta firmware from Tentec. I have downgraded and this issue persists.

Any input?

Regards,
Ken

Ken,

Sounds like a phase lock loop is not locking up properly. I would call TT service. It may need an internal adjustment.

I have seen hints of this kind of behavior myself, but it has never lasted long enough to warrant tracking down. It might be related to operating temperature, power voltage level, etc.

As always with a strange Orion problem, you need to do a Master Reset and/or Battery Reset to be sure that doesn't cure the problem. But, if you've reloaded firmware, you must have done resets, yes?

I am on the latest beta version of the software. I am going to rollback to ver 2.057 and check it out. I will do a master reset and not sure how to do the battery reset.

Regards,
Ken

hello Ken,

memory reset -> switch off rig, push & keep pushing LCK B button, switch on power. Wait for battery messag and release LCK B button.

Then follow with normal reset -> switch off rig, pusj and keep pushing ANT 1A button, switch on rig... wait for message, release ANT1 A button....

2056 would work well too. but somohow i dont think vfo lock is going to be solved in this way...

best regards, onno

Thanks Onno. I got it now. Do you think 2.056 or 2.057 is better? I used your Orion Macro during last low band season and set the ProgramableAGC well. Its all gone now. I will download your program again to set it.
I need to get that proper value in for 80mtrs.

I made a mistake a few days ago on my own message regarding release 2 firmware. 2056 is certainly a good option to choose if you want clean audio. Alternatively you could go for release 1 firmware, 1372 or the last 1373B5. Release 1 code works well too.

Release 1 -> excellent noise reduction and most functions actually work. But less performant control and screen resolution
Release 2-> good performance control and screen resolution. 2056 clean audio, even better then release 1. But some features are broken, such as voice recorder.

Hope this helps, best regards, Onno

Thanks for that again. I will now go to 2.056. I have never used the voice recorder anyways, so it doesnt matter.

Regards,
Ken

Ken

Mine has been doing the something like that (I think) for sometime now.

When I power up after the rig has been off for an extended time (more than 8 hours) there is no signal or audio. If I push thru the abnds on the number pad and comeback to 20 meters, BAM there it is working fine

I emailed TT and their reply was "WE HAVE NEVER HEARD OF THAT AND DO NOT KNOW WHAT IT COULD BE"

So far I have lived with it but I'm headed to TT area for a 1 week vacation next month and I will drop it off to be looked at

Good luck

John

Subject: [orion565] startup

Folks,
I have been noticing an issue during the startup of the 565 radio. I wanted to see if anyone else has seen this one.
When I start the radio and if I am on 20m, the radio after bootup will not exactly be locked on 20m. (dont know where it is receiving) I would usually switch to 40m and come back to 20m, then I would get proper receive on 20m. This only happens during startup on 20m. If I startup on 40m, the issue doesnt seem to be there.
I am using the latest beta firmware from Tentec. I have downgraded and this issue persists.

Any input?

Regards,
Ken

John,
Thats exactly correct. If the radio is warm, it will come up on 20m without audio or reception, but after a few secs it will get fully crackling. When it is cold its looks like an issue with the synthesiser board and it locks in when we go to 40 or 17 and then get back to 20m.

Regards,
Ken

John and Ken,

It seems to me that I saw a problem like this many years ago that I traced to defective tantalum capacitors...they would not form correctly each time when power was applied. It would not always happen, but when it did, it pulled the voltage supply line down just enough to make the circuit not operate correctly. Tantalum caps are great for bypassing power lines in radios because they have good freq. response characteristics but they can drive a person crazy if a manufacturer gets a bad lot of them. I found them by measuring the supply line voltage and noting that it was slightly low in some parts of the circuit board. Have fun!

John,

Since you mentioned that this cleared up when you changed bands, I have ran across something similar several times and finally found out what was going on. I have a LDG tuner in my 565, and it seems under certain conditions (not sure what causes the initial problem) the bypass relay in the tuner is not 'bypassing'. Once I go thru a tune cycle, it clears it up.
I have a feeling it's something to do with PC control of the rig and the state things are in when the software that controls it is shut down, but I can't prove it.
After that tune cycle it will work fine, with the tuner enabled or disable.

Not sure if this is the same thing in your case, but I thot I'd mention it.

Ten Tec launched a new radio today at their hamfest.
I watched some of the live feed from their website. The radio is called Eagle. Looks like a nice small format 6M + 10 thru 160m radio.
No mention of anything on their website.

They also introduced a new cross-needle wattmeter last month at the Huntsville Hamfest, model 1225 which I don't think has made it to their website yet either

It's there. Go to the Tentec home page. There is an "Announcement" line
that says New Tentec wattmeter HF kit. Click on that and it will take you
to the page. "Now available and shipping".

With the release of the EAGLE, the new HF transceiver, I would expect this
page to get updated next week.

I was at the hamfest yesterday and really enjoyed meeting many of the folks
both from Tentec staff and many that communicate here on the reflector.
Also enjoyed seeing the Tentec products in operation.

6359. 565 Audio output levels

Yahoo group: orion565 (2009 — 2013)
Date: 2010-09-30 05:24:13 UTC
From: Martin Sole
Topic: 6359 Message: 6359

Been away for a few weeks but finally got to look at my Orion audio output levels.

I had been trying to understand why the aux out and line out levels seemed to be very low. An S9 signal producing a 1kHz audio tone measured about -27dBm into a 600 ohm load. After changing the software from 2.062 to 1.372b5 this increased to about -17dBm and is now enough to drive my PC audio card much better. This still seems low compared to the Ten-Tec spec of 0dBm into 600 ohms but I presume it has changed often as the software changed.

I'll go back to using 1.372b5 for a while and see if I can live with the lack of band stack register indicators, fixed slope AGC, and other little niggles.

I did notice that there is no DC on either the AUX OUT or LINE OUT sockets and looking at the schematic there is a 100uF electrolytic in series with the outputs and a 100k resistor to ground on the output side for the AUX OUT connections and a 4.7uF with 100k to ground on the output side of the LINE OUT.

I definitely feel there is a lot more drive to the speaker as well. It comes from a similar place.

I suppose the change in levels with different versions of software must another of the trade-offs necessary to incorporate the V2 changes.

BTW. Any news on the next revision of the 565 software?

Martin, HS0ZED

Over the weekend I will measure audio output on the same connectors and share what I have found. at least we can compare notes then :-)

I have no problem with low audio output on speaker and/or the din connector. driving the audio card is not a problem.

You are right (and I was wrong) about the dc voltage. That seems to be a problem for 566 only...

More to follow, best regards, Onno

Topic: 6359 Message: 6361

Hi Onno,

Yes I saw the extra components necessary to block the DC on the interface card that holds the various interface connectors so all looks good on that score.

I'm still not really happy that the audio output is at a sufficient level and having upgraded my sound card to a Delta 44 it has made a borderline case somewhat worse. Whilst the on board C-Media sound processor would handle low level inputs through its mic socket, complete with switchable preamp, the Delta 44 is a line level device and wants in the region of 0dBm +/- 10dB or so. I'm thinking now that the only reasonable solution will be to add some sort of amplifier, externally or internally (Orion is a big box!) in order to boost the output to this sort of level. I'm thinking that this will be even more useful in view of the fact that V2 software seems to have an even lower output level.

Would be interesting to know if the next release of 565 firmware will address this in any way.

6362. Orion 565: grey / white LCD contrast fix

Yahoo group: orion565 (2009 — 2013)
Date: 2010-10-02 17:48:27 UTC
From: pa1ap
Topic: 6362 Message: 6362

Greetings,

I appears I have finally solved the contrast saturation issue with the grey/white LCD screen. Besides improved airflow I have also changed the backlight intensity which cured the saturation issue.

I have no cold to warm issue anymore, nor does the unit occur long term heat saturation as I had before. The modification is simple and requires three (3) normal diodes to be put in serie with the backlight wire (reducing the voltage to the backlight leds). This will reduce the intensity of the LCD screen and as a site effect it apparently prevents thermal heating to occur. I have the modification running little over three weeks now and it remains stable. Also the white on black is much more black then before.

The funny thing is that Tentec included PWM in the original design but apparently never cared about actually using PWM towards the backlight. In other words, it is a constant DC voltage instead of PWM... If TT would activate the PWM signal and provide access through the menu to the PWM signal then we could adjust brightness and contrast to arrive at optimum settings. But this is unfortunate not the case, hence the diode trick. Perhaps a feature request to TT?

Hope this is useful for others who are annoyed by the contrast ghost images...

73, onno pa1ap

Onno:

Have you received any feedback from TenTec about this fix?

No I did not. I will send another message to TT and wait for their answer.

I have spend a lot of time investigating the issue and tried many different things so far. This has been the most effective fix so far at my end.

I measured at R715 with an oscilloscope but at my unit it was just 5 Volt DC. It might be a fault in my unit but then again I heard several comments on poor contrast before.

Fix is easy to include / remove if needed.

When I have response from TT I will update on the topic.

6365. Experiment with BLUE LCD screen

Yahoo group: orion565 (2009 — 2013)
Date: 2010-10-16 16:18:23 UTC
From: pa1ap
Topic: 6365 Message: 6365

Greetings,

I am investigating the BLUE lcd screen timing issues which cause poor blue on white and weird refresh issues. My plan is to use a PIC as controller between 565 cpu and LCD logic to clean up the timing and sequencing.

The TT 565 LCD does not include a lcd controller and all timing and logic needs to be provided by the TT 565 embedded cpu. And as we can see, with every firmware release the quality varies up and down. I suspect the cpu does not have resources available at times which results in poor display timing.

The PIC would become a special LCD controller (timed latch / flip flop) and targets to offer optimized timing and sequence towards the LCD regardless of what the TT 565 CPU believes is correct. THis way the LCD will be driven correctly and the quality would become independent of the firmware. This will also improve the original grey/white screen.

Any suggestions and / or experiences are appreciated.

Hi Onno,

Did you just put 3 regular si diodes in series with the wire from the connector on the dsp board going to the backlight? Think I might try this whilst I have the radio apart.

Yes indeed. Perfect contrast with no backlight but thenyou cannot work without ambient light.

Hello

Just learned from another TT list that there is a Built-in Clock chip

with a battery. It sure would be nice to have had that enabled.

And while they are soliciting ideas for improvement on the O1 firmware,

may I suggest a visual spot annunciator.

With 566 there seems to be a small design flaw and DC (5V) is put on the audio output pins (on the din plug)... Try to decouple using capacitor which prevents any transformer from saturating. I don't know the rigblaster internals... I assume it has a 600:600 transformer? If not included already within the rigblaster, include a 600:600 transformer to provide decoupling.

Hi all,

My Orion 565 shuts down on transmit only on the 20 m band with power at or above 55 watts into a Hustler vertical. Even pressing the tune button causes the machine to shut down. I have to recycle the power switch on the machine and also on the power supply to get the machine to power back up. No symptoms on any other band.

Any help much appreciated.

Mike K7MSO

Likely RF back into the radio. Common mode chokes installed on the coax
at the radio and on the DC power leads at the radio should correct the
matter. You may have to put them on the AC line at the power supply as
well. Start with the coax at the output of the radio as the first step.

Topic: 6377 Message: 6377

I'm hoping someone on the group can help me.

I purchased a used Orion II, and I am unable to update the unit to the latest software. It is currently running 2.039D software. I have the rig connected to the Com 1 port on my Windows 7 machine with the included RS232 cable. I believe the connections are all fine as Ham Radio Deluxe works fine using this port and operating the Orion II. I reboot my Windows machine prior to powering up the Orion II so that everything starts from scratch.

I followed the Ten Tec instructions - Turn on radio while pressing User 2 - I get the appropriate "Flash Update Mode" showing on the Orion II screen. I then start up the update software, make sure Com 1 is selected, select the 2.044A file, and then the program starts. It says "Using Serial Interface" and then nothing appears. After a few seconds I get a "Communication with the radio has failed......." message.

I've also tried connecting the cable / radio to Com 2, as well as a USB / RS232 adapter. All get the same error message. Any ideas?

From: Fernando
Topic: 6378 Message: 6378

Hello.

I had this problem with the contrast dimming when I'd key the rig on my Orion 1.

I hadn't notice it but it seems to gradually get worst.

Searching the web I came across Ron's (N6IE) webpage describing

the replacement of the capacitors on the A9 board.

Well, I did that and it fix that problem.

As an extra, I went ahead and replace the molex connector and

replace it with Power Poles. I got my cue from the new Eagle

which has them.

It was a simple desoldering of the connector pins from the board

and putting in the PP.

Hope this helps someone and encourages another.

On the power poles -> Did you by any chance make pictures? Besides removing the covers, what else needs to be dismounted?

And can you share the type of power poles used? I guess it is the pcb version (20 amp or 40 amp?)...

Below is what I found on the internet:

http://www.powerwerx.com/anderson-powerpoles/housings-contacts/

Could you advice? Much appreciated!

Thanks and regards, Onno pa1ap

From: pa1ap
Topic: 6377 Message: 6380

Thats an interesting challenge.

1) cable is correct -> you can control rig with HRD
2) serial port is correct -> see #1
3) burning the firmware does not work...

Typically if you start the firmware upgrade tool you will see in bottom right corner a message about DPS version xxx or something like that. This once you have connected to correct serial port and starting the upgrade. If you do not see this, something is wrong in the communication.

Did you change anything on the computer drivers? Did you enable FIFO on the serial port? Are you using any serial port virtualization software? If you start the firmware upgrade program, how many serial ports can you select? COM1, COM2 etc...?

Some time ago I had a TS-2K and learned that my computer was to fast for the firmware upgrade. After troubleshooting I learned I had to enable FIFO and set receive and transmit buffers at certain value to allow the firmware upgrade to succeed. I am not suggesting this is the case for Orion, but it might be worth checking... If you do decide to fiddle with fifo, please take into account you have to disable and enable the serial port before the change becomes active.

6381. Orion 565: problems with antenna relais

Yahoo group: orion565 (2009 — 2013)
Date: 2010-10-24 09:36:05 UTC
From: pa1ap
Topic: 6381 Message: 6381

Greetings,

Seems one of the relais has a dirty contact or something like that and I hope someone can advice best solution. here is the sympthom: when connecting antenna to ant1, output power is limited and swr is really bad. When switching to ant2 (after change over same antenna), full output power and swr is just fine. Also receive is on ANT1 poor when comparing rx through ant2. In the past I was able to fix the issue by switching the relais through software (quick switch sequence of 20.. 50x)... but now that does not really work anymore.

Is this a known issue and does someone know which relais needs to be taken care of and how this can be replaced easiest?

Thanks for advice, regards, Onno

6384. Re: Orion 565: problems with antenna relais

Yahoo group: orion565 (2009 — 2013)
Date: 2010-10-24 12:00:17 UTC
From: pa1ap
Topic: 6381 Message: 6384

While going step by step troubleshooting I learned that the build-in antenna tuner despite being disabled in the menu was actually in-line somehow...

After I enabled the antenna tuner through the menu, hit the tune button, the usual click clack click happened and full output achieved into the already resonant antenna (ant 1). Then I disabled the build-in antenna tuner and it all remained perfect. Changed bands and all is back to normal again.

At the moment I am running 1372 and it seems that sometimes the tuner is being put in-line without instructions to do so. Hence bizar high swr and low output. This does not happen often, but when it happens its a bit confusing...

>
> Greetings,
>
> Seems one of the relais has a dirty contact or something like that and I hope someone can advice best solution. here is the sympthom: when connecting antenna to ant1, output power is limited and swr is really bad. When switching to ant2 (after change over same antenna), full output power and swr is just fine. Also receive is on ANT1 poor when comparing rx through ant2. In the past I was able to fix the issue by switching the relais through software (quick switch sequence of 20.. 50x)... but now that does not really work anymore.

You might try checking the settings of your serial port. When I do an upgrade, I use these port settings:
speed – 57,600 bps
parity – none
data bits – 8
stop bit – 1

Hello

Pictures on my webpage.

<http://pages.sbcglobal.net/nf6q/>

I need to rearrange the page but for now it will do.

Power Poles are the

PP30 (30A). You need some 1/16 (1.57mm) brass tubing and

optionally a Power Pole retaining plate for stress relief.

You don't really need the retaining plate but I have some

and not afraid to drill holes. hi..

More details on request.

excellent pictures and thanks a lot for sharing! It looks very nice and it is worth the change I believe. Smart move on the modification to the original power poles with the brass tubes. Its on my list of next to do...

By the way, please check the fuse next to the power connector. With my rig the fuse was very oxidized and hence giving poor contact as well. It was near black...

6390. Re: Can't Update Orion II

Yahoo group: orion565 (2009 — 2013)
Date: 2010-10-24 20:55:54 UTC
From: pa1ap
Topic: 6377 Message: 6390

In case you have not been able to troubleshoot, I have uploaded a windows program which could help troublshooting.

http://groups.yahoo.com/group/orion565/files/Serial%20port%20testing.zip

Program allows you to connect to any serial port. If it connects with both port and CTS up it will automatically check if a ORION is connected. If so, the program will confirm with happy face. If not, the program will allow you to test ORION TX (power recycle needed) as well ORION RX. If the cable is broken (for example TX wire) you will find out very quickly. Same for RX wire and/or CTS wire.

It is not much but it will eliminate any serial port configuration as I have included hardcoded values for the serial port variables.

Best regards, Onno pa1ap

It's a one in a million event, but a strand from a ground braid brushed against my Orion 565 once. At least on my fuse, there were tiny openings in the plastic which exposed the metal within-and the braid strand poked into one. There was quite a flash and a pop followed by a few curse words. Fortunately the Orion worked when I replaced the fuse.

Onno

Thanks and yep the fuse here was tarnished as well.

Used a pencil eraser and shined it up.

Onno
thank you very much for this program. While I did get my Orion II updated
using an old XP machine, your program will let me diagnose why it won't work
on my Windows 7 machine. As John shared in another post shared, I suspect it
is the speed of my new machine (Intel I7).

thanks!
Gary

Check FIFO settings on the serial port. I suspect it is set to maximum value. Adjust it to about 50% to see if that will help.

6395. Re: Orion 565: problems with antenna relais

Yahoo group: orion565 (2009 — 2013)
Date: 2010-10-25 12:31:58 UTC
From: Anthony Bowyer
Topic: 6381 Message: 6395

Onno,
I have seen this issue as well. It seems to be related to the bypass relay on the tuner. Seems there is a condition where this relay is not engaged, so the connection from the PA (and filters) to the antenna is basically wide open.

I suspect there is some combination of events that places the tuner in a state of "limbo". A superficial observation on my part, leads me to believe there is little if any CPU 'handshaking' with the tuner, and so there is a great number of assumptions made in the firmware regarding both it's actions and it's state.

I usually have it disabled and use an external tuner (since I run an amplifier much of the time). Even disabled, this has happened to me. Usually changing bands will get things working until I switch the Orion off and back on, and it is in this state again.

I have found one thing that corrects it: enabling the tuner and running it through one tune cycle. Then it can be disabled and all will work well.

I haven't been able to find the exact combination of events that cause this condition. I suspect in my case it has something to do with shutting down the Orion while I'm using HRD to control it (PC control). Unfortunately it is a random event and I can't seem to duplicate it. It has happened to be at least 3 times in the last year however.

Anthony, K4ZNO

In as much as the radio provides an Aux or Line input, I do not connect anything to the mike input except a mike. Much less issues to deal with.

The RigBlaster seems to be one of the more popular devices. At the same time, in doing AFSK and other digital modes, I have been very successful not using any interface, just connect the radio to the computer sound card input and output. I use the Windows Mixer to handle the level controls. I use the VOX to handle the RX/TX switching.

Omno,

I tried to run the setup program in the zip file you shared to test the
Orion II communications but I get an error message "Unable to install or run
the application. The application requires that assemble
Microsoft.VisualBasic.PowerPacks.VS.Version10.0.0.0 be installed in teh
Global Assembly Cache (GAC) first. Please contact your administrator."

Any ideas? I downloaded and installed PowerPacks V3.0, but still the error.
Is there a program I need to download from Microsoft?

oops... I am so sorry.... i will compile a new version for you tonight when home.. I might have forgotten to include the reference to this library during compilation of the package.

Normally the distribution will indeed check for additional microsoft packages required and during first install it might prompt for your confirmation that a missing package needs to be downloaded. This should happen automatically (after you confirm), including the download and installation... unless the developer is silly enough not to include the references...

Hello all gentlemen,
just got my 712 USB cable and for some reason I have no output power when I transmit. I can hear a signal on my receiver, put neither the Orion nor the tuner show any output! Has anyone experienced this? Running software 1.373b5, the tuner is MFJ 993b. Thanks for any help!

Hi Richard,

First, go to your menus screen, select SSB then set your TX Audio source to AUX. I don't operate phone much so this is not a problem for me. You may want to select BOTH so you don't have to make changes when you want to use the mic for a SSB contact.

Next go into your audio devices in the computer settings via control panel or which ever for your OS. Set the mike and speaker default setting to the Ten Tec USB device. Mine shows up as CODEC in the description.

Then depending on which software program you are using, make sure the soundcard settings are going to use the TT USB device.

Hope this helps.

Be sure to adjust Aux Input Gain while you're in the SSB Menu.

Barry,

Where did you set yours? I did not make any adjustments to mine. It is set at 10. I have only been working a little PSK and am very new to this mode.

Is the digital software on the computer set correctly? I use MixW2 and there is a set-up menu for receive and transmit. It uses the Windows mixer to control the levels.

I do not advise setting the audio to BOTH. This could allow room sounds to be transmitted via the mike in the digital or CW portions of the band and could allow anything on the computer, Windows sounds or other program material, to be transmitted otherwise when not being used for digital modes.

Hi folks. I powered up my Orion this afternoon and inadvertantly had the antenna switch set to ground. I made one brief SSB transmission and the rig shut down, sensing the very high SWR. Now it won't power back on. I get a few faint LED's, but no diaplay or audio. Is there an internal fuse or circuit breaker? I'm very surprised that a two second transmission into a high SWR would defeat the protective circuitry in such a high quality transceiver. Ahy thoughts or suggestions would be appreciated. Thanks! W8OC

Hi folks. I powered up my Orion this afternoon and inadvertantly had the antenna switch set to ground. I made one brief SSB transmission and the rig shut down, sensing the very high SWR. Now it won't power back on. I get a few faint LED's, but no diaplay or audio. Is there an internal fuse or circuit breaker? I'm very surprised that a two second transmission into a high SWR would defeat the protective circuitry in such a high quality transceiver. Ahy thoughts or suggestions would be appreciated. Thanks!

Did it power up again after a period of cooling down? There seems to be thermal fuse in the finals... I once transmited with poor swr (did not check) and the unit heated up quickly and shut down. It did not came back for the next 10 minutes or so. I figured the protective circuitry did its job well. Best regards, Onno

Sounds like the A9 board (power distribution) is bad. The two events, board going bad (if that's the problem) and you transmitting into a short have probably have nothing to do with each other.

If I'm right, you might be able to repair it yourself. The small board is located on the bottom of the unit and has two 470uF / 15 volt caps on it. They are probably bad and need to be replaced with 470uF / 50 volt caps.

Good Luck,
Sam

hello
How is it going?
Just received my 2010 Suzuki RM-Z 450 from this website. www.mgjzs.com much cheaper than others and genuine . if you would like to get one,you can check it out.They have many other items .
have a good day...
Cheers,

Thanks to all that provided suggestions. I discovered the problem and it wasn't the rig! It was the Astron switching power supply. Although it was running, and powering back lights in several accessory devices, it was not providing enough juice to fire up the Orion II. I'm not sure what went south, but will did into it over the weekend. Although I feel relieved that the rig is OK, I'm surprised and rather curious about the faulty supply. First time I've ever had a problem with a switching supply failure. Guess I've been lucky! 73 and tnx agn to all. Al

I've never had a failure of the Astron switching supplies. However, that
is one reason I purchase and use the SS-30M version. I have 3 of them.
The "M" is the one that has meters on the front.

I looked at mine some time ago using the spectrum analyzer. I did both the radiated and conducted EMI tests. No noise from any of mine down to -140 dBm or so. I think that is equal to a minus S-2 in equivalent level if S-0 is -127 dBm.

6423. TenTec Product Status Update

Yahoo group: orion565 (2009 — 2013)
Date: 2010-11-10 20:09:10 UTC
From: John
Topic: 6423 Message: 6423

In order to help keep our customers up to date with what is going on within TenTec, I'm posting the following:

1 - Eagle - We are working on a Software Update for the Eagle, which should be posted to the Internet for download by Thursday of this week. 11-11-2010 (if it isn't up by Thursday, it will be up Monday of next week, never release firmware on a Friday). This software will provide more CAT functions as requested by customers, includes a few items to assist in factory test automation, also includes the audible QSK Delay function, etc.. I am also planning on releasing the official programmers reference manual to support the firmware release version a day or so later.

2 - Orion 565 Firmware Update - Now that the Eagle is maturing to a more stable baseline, I am restarting the efforts on the Orion 565 Firmware Update process. This release is intended to resolve a few known issues, and to get to a baseline that performs best for contesting. This means that some changes may not be exactly as per desire of some casual users, but the main purpose of the Orion and Orion II are to provide the best contesting rigs that TenTec can offer, so that original philosophy will remain in tact for this coming upgrade. Goal is to have the beta group informed of the schedule by the end of next week. Have the set of changes required finalized and a schedule for release committed to by the end of next week. This doesn't mean the update will be ready next week, but a firm schedule will be in tact and I can then share it publicly by then. Target date for the entire update is before the end of the year. I think that it is possible, however it is very aggressive, and may not be met, but that is the goal.
One MAJOR note to make, this will be an update based on V2 firmware, not V1. It may mimic the functionality now seen in the latest Orion II firmware release. But the main goal is stability, removing receiver losses, etc.

3 - High Speed Sweep Board - Yes, it has frozen over...., The High Speed Sweep is back on the development path. We are working with a 3rd party vendor who has committed time and resources to complete this project. When a schedule is made more firm, and we seem to be meeting the early milestones, I may indicate a projected production start date, I may not, will have to see as time progresses how the venture works out. Either way, we are committed to providing this functionality with the best "wow" feature set for a built in sweep that we can provide with the hardware/firmware/DSP/etc that we have in the Orion 2 and OMNI-VII.

4 - Jupiter Update - Providing a resolution to the receiver lockup when turning on AN/NB/NR all at the same time, adding a feature if possible as requested. Projected update timeframe - December 2010

5 - OMNI-VII - There is a request from ESSB operators to provide SB transmit bandwidth up to 6kHz. Currently reviewing with the league, if the HW is capable, etc. Feasibility is being reviewed.

Yes, we are working on several other projects at the same time that may also be finished and made public during the timeframe of the Orion 565 and HSSB projects, but once I commit to a schedule, I will do everything in my power to get it completed on time, with quality, and with the customers desires in hand.

Best Regards,
John Henry
TenTec Engineering

6426. Cannot update Orion ll and factory support was no help at all

Yahoo group: orion565 (2009 — 2013)
Date: 2010-11-16 20:08:04 UTC
From: oreradioguy
Topic: 6426 Message: 6426

I tried to update my Orion ll yesterday but kept getting a communications error shortly after invoking the update command. I put the orion in the firmware update mode by pressing user 2 button and powering on. I tried this with two computers as suggested by Ten Tec, one running Windows 7 and the other running XP. I use a USB to RS232 adaptor and it works flawlessly updating my Elecraft K3, my AIM 4170C, and using W4PY remote program that runs the Orion ll perfectly. I seem to remember years ago having a similar problem and being forced to use a computer that had a true RS232 connection. This is not possible for me anymore and as anyone knows, computers these days do not have such outputs, especially laptops. Ten Tec told me maybe my radio was defective perhaps and to have me send it in and thats just not true. They have a problem with their software being used with USB adaptors. When you can control all functions of the radio with one program and the other does not work--duh! Has anyone had similar problems and were you able to solve without using true RS232 port? If I had this problem with Elecraft the problem would have been solved years ago.

I was the one that posted the issue trying to update my Orion II. It ended up being Windows 7. I put an RS232 card in my Windows 7 machine and it still wouldn't update.
When I updated it via an XP computer, everything went fine although it did have an RS232 card that I plugged in to. I believe the program has more to do with the speed of the machine than the operating system. Did you try the programs PA1AP put on the Orion565 yahoo group in the files section? It tests your RS232 connection / USB connection.

Well, I am using USB based serial dongles from various brands without isues. also the serial port on the motherboards works.

You might want to test the communication using a serial console program and test the connection in this way. Or use the windows program I recently uploaded for testing communications. It should provide a very easy way of validation.

It could be a problem with the serial cable being wired different than expected. It could also be the serial controller on the logic board being burned due to static discharge... Happens when the orion has different ground than your computer...

For the Orion you will need a serial cable with hardware handshake wired correctly. If not present, firmware will not be burned into the unit as far as I know.

Hope this helps, 73 Onno

I put the orion in the firmware update mode by pressing user 2 button and powering on. I tried this with two computers as suggested by Ten Tec, one running Windows 7 and the other running XP. I use a USB to RS232 adaptor and it works flawlessly updating my Elecraft K3, my AIM 4170C, and using W4PY remote program that runs the Orion ll perfectly. I seem to remember years ago having a similar problem and being forced to use a computer that had a true RS232 connection. This is not possible for me anymore and as anyone knows, computers these days do not have such outputs, especially laptops. Ten Tec told me maybe my radio was defective perhaps and to have me send it in and thats just not true. They have a problem with their software being used with USB adaptors. When you can control all functions of the radio with one program and the other does not work--duh! Has anyone had similar problems and were you able to solve without using true RS232 port? If I had this problem with Elecraft the problem would have been solved years ago.

I had similar flaky comms problems where HRD would control the radio, mostly, but the update software would not, mostly. There was sufficient communications activity to suggest that all was well with the radio yet clearly something was off somewhere.

Whilst I cannot absolutely guarantee it, the problems have not re-occurred since I changed the back up battery. Worth a measure to confirm it is up to spec.

I can only assume that the Ten-Tec software exercise the port differently, in some way. Certainly no difficulty with using USB adaptors, the Orion seems more than happy with 3 wire RS232 and either XON/XOFF or no handshake. Will not work in some cases with Hardware handshaking though.

Regards

Martin, HS0ZED

Well Brad, that may be the best idea because I do not think Ten Tec cares about supporting their customers anymore.
Perhaps if they did it would not take years for firmware releases. I certainly am not the only one who has complained
about their software not working. I loved the comment they made to me over the phone "We don't know much about
computers." Priceless! If someone wants to buy an Orion ll they can contact me off list and I would order a second
K3 in a heartbeat. LOL

I tried to use the program you uploaded but get an error about it needing something as reported by a previous person here on the reflector. Something about a Microsoft update to a library, I do not recall exact error message but happens on both of my computers, one running Windows 7 and the other XP. I have three computers all of which are built within the last year or two and none of them have a serial port or a place to put a serial card. Therefore I must use an adaptor. The adaptor is a Keyspan. I can control the Orion ll perfectly using W4PY's Orion program. It sends commands and responds flawlessly. As I stated before this same cable combination works flawlessly when used with Array Solutions Aim 4170C antenna analyzer and to control or download firmware on an Elecraft K3. Since the only thing that does not work is the Ten Tec firmware update and others have reported the same, I think there is something not right in there code even though some users report no problems. I am fairly certain if I had a older computer with a serial port that it would work. I just do not think I should have to go buy a old outdated computer to complete this task. Someone at Ten Tec should really address this issue. I know for a fact if I reported such an issue about an Elecraft product, they would be contacting me and working hard to fix the issue. As a matter of fact they would not let me off the phone until they did solve the problem or would tell me when they would. I am using quality computers and adaptors that other vendors write software for that works using the same hardware. Where is this legendary support or is it just false marketing? Ten Tec claims they monitor this reflector so they should certainly pick up on this thread.

Onno,
I tried your software as well and it says that it "requires that assembly Microsoft.VisualBasic.PowerPacks.Vs Version 10.0.0.0 be installed in the Global Assembly Cache (GAC) first." This is the same error message I was getting previously when you first uploaded the initial release.

I'm wondering if the Orion requires hardware handshaking to update? The
Keyspan USB to Serial as well as most other USB to Serial adapters only
supply software handshaking.

Just an idea.

Just the same problem-Orion II is contlolled flawlesly via PCI Serial card,
but the Updating is possible
via true Comport only!

6437. Modify RX IN ?? for SDR receiver use

Yahoo group: orion565 (2009 — 2013)
Date: 2010-11-18 19:01:36 UTC
From: saukp
Topic: 6437 Message: 6437

Question to group..

i have searched the group past message to see if the following has been done but cant find any messages that seem to cover my question

so my question.
Has anyone modified the Orion RX IN on the back panel to bring out either ANT1 or ANT2....or main receiver antenna input or antenna sub receiver input?

my reason is to be able to hook up an sdr receiver(for exapmple sdr-iq) to same antenna the Orion is using in receive mode. This would allow use of the sdr receiver as panadapter (sort of) but when used with N4PY software can have the sdr track orion main receive freq and can do click on freq control of the sdr to control orion receive freq.

any thoughts out there about this?

thanks

Paul K3SF

First of all I want to thank many of you for your comments and suggestions regarding the issue I have been having trying to do the firmware update. I believe Ten Tec has taken ownership of this issue now after speaking with members there today and that they will do their vary best to resolve the issue. This is a complicated issue for many reasons I will not go into at this time. I have been assured the problem will be solved and I firmly believe them. I should have more news soon and will give an accurate update so that others with this same type of problem can resolve it too. The Orion ll is therefore not up for sale and I look forward to being a happy customer of Ten Tec again. Thank you all and Ten Tec.

6441. Re: [orion565] Re: Cannot update Orion II but help is in the works

Yahoo group: orion565 (2009 — 2013)
Date: 2010-11-18 23:08:17 UTC
From: Bob McGraw - K4TAX
Topic: 6426 Message: 6441

Again, here's what John Henry had to say to the various reflectors on Nov. 10 of this year.

From my point of view, looks like they have a handle on most of the issues. I am aware of a recent driver update, one of those that is done in the background from Microsoft, that has caused some issues updating certain radios via the USB port. Although, those radios worked well with the prior hardware and other software applications, problems were caused in the update process. Yes, Tentec is aware of this and I'm sure these points will be addressed with the next release of Orion and Orion II firmware.

In the mean time, here's what John had to say.

73
Bob, K4TAX

<snip>
In order to help keep our customers up to date with what is going on within TenTec, I'm posting the following:

1 - Eagle - We are working on a Software Update for the Eagle, which should be posted to the Internet for download by Thursday of this week. 11-11-2010 (if it isn't up by Thursday, it will be up Monday of next week, never release firmware on a Friday). This software will provide more CAT functions as requested by customers, includes a few items to assist in factory test automation, also includes the audible QSK Delay function, etc.. I am also planning on releasing the official programmers reference manual to support the firmware release version a day or so later.

2 - Orion 565 Firmware Update - Now that the Eagle is maturing to a more stable baseline, I am restarting the efforts on the Orion 565 Firmware Update process. This release is intended to resolve a few known issues, and to get to a baseline that performs best for contesting. This means that some changes may not be exactly as per desire of some casual users, but the main purpose of the Orion and Orion II are to provide the best contesting rigs that TenTec can offer, so that original philosophy will remain in tact for this coming upgrade. Goal is to have the beta group informed of the schedule by the end of next week. Have the set of changes required finalized and a schedule for release committed to by the end of next week. This doesn't mean the update will be ready next week, but a firm schedule will be in tact and I can then share it publicly by then. Target date for the entire update is before the end of the year. I think that it is possible, however it is very aggressive, and may not be met, but that is the goal.
One MAJOR note to make, this will be an update based on V2 firmware, not V1. It may mimic the functionality now seen in the latest Orion II

firmware release. But the main goal is stability, removing receiver losses, etc.

3 - High Speed Sweep Board - Yes, it has frozen over...., The High Speed Sweep is back on the development path. We are working with a 3rd party vendor who has committed time and resources to complete this project. When a schedule is made more firm, and we seem to be meeting the early milestones, I may indicate a projected production start date, I may not, will have to see as time progresses how the venture works out. Either way, we are committed to providing this functionality with the best "wow" feature set for a built in sweep that we can provide with the hardware/firmware/DSP/etc that we have in the Orion 2 and OMNI-VII.

4 - Jupiter Update - Providing a resolution to the receiver lockup when turning on AN/NB/NR all at the same time, adding a feature if possible as requested. Projected update timeframe - December 2010

5 - OMNI-VII - There is a request from ESSB operators to provide SB transmit bandwidth up to 6kHz. Currently reviewing with the league, if the HW is capable, etc. Feasibility is being reviewed.

Yes, we are working on several other projects at the same time that may also be finished and made public during the timeframe of the Orion 565 and HSSB projects, but once I commit to a schedule, I will do everything in my power to get it completed on time, with quality, and with the customers desires in hand.

Best Regards,
John Henry
TenTec Engineering

First of all I want to thank many of you for your comments and suggestions regarding the issue I have been having trying to do the firmware update. I believe Ten Tec has taken ownership of this issue now after speaking with members there today and that they will do their vary best to resolve the issue. This is a complicated issue for many reasons I will not go into at this time. I have been assured the problem will be solved and I firmly believe them. I should have more news soon and will give an accurate update so that others with this same type of problem can resolve it too. The Orion ll is therefore not up for sale and I look forward to being a happy customer of Ten Tec again. Thank you all and Ten Tec.

I have my O II connected to my computer (running XP pro), with a Radio Shack USB/Serial cable. I have never had a problem downloading the firmware. Not sure what the issue is with RS232. That's kind of old news, isn't it?

I was the one that posted the issue trying to update my Orion II. It ended up being Windows 7. I put an RS232 card in my Windows 7 machine and it still wouldn't update.
When I updated it via an XP computer, everything went fine although it did have an RS232 card that I plugged in to. I believe the program has more to do with the speed of the machine than the operating system. Did you try the programs PA1AP put on the Orion565 yahoo group in the files section? It tests your RS232 connection / USB connection.

Try to connect your radio to a machine with true COM port. This should
help, the culprit is mostly the USB/Serial cable.

I think the OP's problem is that none of his computers have a real serial port and it is unreasonable to expect to have to provide one for a radio to work correctly. I agree with that and have never had a problem updating my 565 with any USB adaptor and have never used handshaking with the rig and have always explicitly turned off handshaking in the Windows serial port setup dialog. I have only ever had a problem when the rig itself was less than 100%.

I really do not think the software has a problem working with USB adaptors but I do think there is a big problem with not understanding how to configure and setup serial ports and usb convertors that leads to so many problems. In my own case I have always been very careful to ensure that the manufacturers drivers are loaded before plugging the device in and not allowing windows to install its drivers which will likely lead to utter failure. YMMV.

6445. Re: Cannot update Orion II and factory support was no help at all

Yahoo group: orion565 (2009 — 2013)
Date: 2010-11-19 21:27:09 UTC
From: John
Topic: 6426 Message: 6445

Had a customer call TenTec stating that he cannot get his update program to update the 566. He can run N4PY and other programs just fine with his 566 and the other vendor rigs he has. But cannot update his rig using the same cabling/interfaces. He is using a keyspan usb to serial adapter. I have the exact same keyspan usb to serial adapter at TenTec. No matter what he tried, he could communicate with the 566, but not update it.
Windows had made some updates that did expose a problem in one of our rigs, but I had not heard of any complaints with other rigs, but knowing Windows, I assumed that their update may have broken this interface as well.
So, I tried the update program for the 566 with the keyspan usb to serial adapter on several computers at TenTec, and it worked fine on all of them. So, the Windows update theory was not valid.
I had tried it inhouse on a development XP Pro system, a Windows 7 64 bit Dell, an HP Vista 32 bit, and a few other in house.
No issues, HRD connected through the Keyspan, and update.exe for the Orion 566 worked as well.
I tried the same computers using the USB to Serial cable that we sell in house, and the same results, HRD/N4PY worked, and update.exe for the given rig also worked.
Needless to say, I tried the same combinations of Keyspan and the TenTec USB to Serial Cable, on those same computers, but with an OMNI-VII and a Jupiter and an Orion 565. Same results, I could not find an instance that failed.
The customer had stated that he has the issue on an apple macbook pro, however, he had also had the same issue on an older compaq that no longer runs.
So, I had a situation where everything I did here worked fine, and his station still would not update his 566.

I know that we have made several mods to the update.exe program between the latest 566 update and the Eagle update, so, for grins, I just wanted to see if it had the same issue. Well, it didn't. He downloaded the Eagle firmware update, and was able to use the Eagle firmware update.exe to program his 566 with the 566 .ruf file.
He downloaded it, ran it, and had it install the orion II 2.044a successfully into his 566.

So, there is a work around for now that will work.
Download the firmware update on the TenTec website for the Eagle, and run it's update.exe program, right now it is Version 4.12. Then, when you go to "process" "Update firmware", make sure you are pointing to the folder that contains the 566 or the 565 or whatever it is you want to update. Then this should work.

This appears to work now properly on computers that the Orion 565 Version 3.xx and the Orion 566 Version 4.06 failed on.

On my list to do now is to provide a new Orion II firmware update that uses the newest update.exe program, and the same for the Orion V2 firmware, and etc.

Had some requests on USB, which really aren't feasible, and it seems that some may need a bit of education on serial, usb to serial drivers, etc., so...

USB to Serial adapters basically have a driver running on the computer. This driver registers itself with Windows and the driver will now intercept all Opens/Writes/Reads/Setups to this "virtual" UART. The driver tells windows what comm port number to use, so when an application program, such as N4PY does a write to comm8, this command goes to the driver. The driver takes it, converts it to a USB command, the chip in the keyspan dongle takes this command and processes it as if it was a physical uart within the computer. Meaning if it is a comm port setup request to turn on hw handshaking or to go to 57600 baud, etc., it sets up the uart in the dongle. If it is a command to send out a command sequence of characters, then the uart in the dongle sends it out. True, the number of wires in USB is 4, and the number of wires in a UART/RS232 is either 9 or 25, the meaning of those wires is totally different. The 4 USB wires are used for USB communications. To some of you this difference is totally obvious, but I'm iterating this here because I've had requests to simply control the 4 USB lines as if they were serial lines, that cannot be done. Some people have asked for a USB interface to be made for the Orion and Orion II, well, that is what the USB to Serial cable we sell at TenTec does. It converts USB to serial.

6446. Can upgrade firmware now and did with great results

Yahoo group: orion565 (2009 — 2013)
Date: 2010-11-19 21:34:05 UTC
From: oreradioguy
Topic: 6446 Message: 6446

The problem with upgrading the firmware here has been solved. My computer, cables, USB adaptor, and the radio are all working perfectly now. None of these proved to be at fault. Yes it is true you can upgrade the firmware with a USB adaptor and the issue was resolved with the help of John Henry of Ten Tec. The problem is complicated and therefore I only wish to thank John for assisting and he was not about to give up--great support! I am going to let John explain here to the group the problem and the solution; stay tuned for his comments as he told me he will post a message about this issue and its resolution here. I am very happy with the new firmware upgrade and I am listening to 20 meters as I write this. The fix is easy as you will see. Thanks to all that made positive suggestions. Please consider this thread as ended except for any praise for John would be well deserved.

John,
thank you for your update but I have another bit of info to share. My update didn't work as well on my Orion II using the usb to serial adapter. I then put an RS232 card in my windows 7 computer and it still didn't work. Lastly I dug up an old XP machine and hooked up the serial cable and all worked fine. I didn't try the USB adapter on the old XP machine.

I'm assuming the new update program fixes this as well, but I just wanted you to know it wasn't just the usb adapter method that didn't work on a Windows 7 machine. My machine by the way runs the new i7 intel processor, so I wondered if speed may have been an issue.

Topic: 6426 Message: 6448

I am aware of an issue, thought to be a recent Microsoft Driver download, that has caused issues with certain USB communications. This is one of those downloads that takes place in the background and the user is likely not aware of the update. Also, it is noted that applications such as OnePlug, N4PY, HRD, and others seem to work just fine with the updated Windows driver. It was first observed when one tried to update the radio that things rapidly went downhill.

Older computers, specifically ones that have not received the update may work just fine. Tentec is fully aware of this matter and I believe have identified the issues. I'm not sure when updates and corrections will be available, but I'm sure they are forthcoming.

Just hold on to your horses and don't spill the beer. There's better days ahead.

Try to connect your radio to a machine with true COM port. This should
help, the culprit is mostly the USB/Serial cable.

Paul,
have you checked out this website http://www.ve7tk.com/9MHz_IF.pdf I believe this works directly with the N4PY software to control both the pan adapter, Orion, and the receiver. I only have read about this, I haven't performed the mod myself although several other owners have.

Hi Paul:

On my website there's also a document on how to put all the software together as well as a link to a youtube video showing the LP_PAN panadapter and N4PY software in action with the Orion.

hi all

i have received two ways to achieve my goal

1. is the VE7TK IF interface
2. is takeoff point at sub receiver antenna input

both ways will work with N4PY software
using an SDR receiver

thanks to all who responded

6453. Orion I RIT Fix

Yahoo group: orion565 (2009 — 2013)
Date: 2010-11-22 13:37:02 UTC
From: Anthony
Topic: 6281 Message: 6453

Just to update the list:

The conductive grease seems to still be doing it's job. The RIT, and all other encoders/switches are still functioning correctly.

This rig has had days of 18 hours on, many days off, vaying ambient temperatures, etc and there have been no RIT malfunctions.

Since I've seen a flurry of Eagle purchases (well maybe flurry isn't the right word!), maybe a few Orion I's will get circulated and this issue might become more "apparent" to other users.

Those who are interested. the fix is in the file section under
"Orion 1 (565) RIT Fix"

Topic: 6365 Message: 6454

Ten Tec Orion 565, Display Fading Very Low Contrast:

I first thought that I would replace the power distribution board, but they were on back order.

The Ten-Tec Orion, Technician told me the -20.5 VDC output should be suspect, since it supports the display's contrast function. I had replaced the filter caps on the 5 VDC circuit on this same board because of a single 470 uf capacitor failure. I changed all three (3) of the filter470 uf, caps on the board because they were the same brand and size as the failed component.
The two (2), capacitors in the -20.5 VDC circuit are (10 uf at 25 vdc) and mounted sided by side. My replacements were from Radio Shack and they are axial leads so the mounting is a little different, (10 uf at 30 VDC).

The display came back to like new contrast so I have not taken on the Blue Screen up grade, I do have the display. The Blue Screen does not require the -20.5 VDC but I normally do not upgrade a unit without the original functionality being restored. If I have to revert to the old design then I still have that option.
On one of the really cold weekends, < 30 F, this winter I will take on the, "Blue Screen Upgrade, might also upgrade the microphone connector to eight (8) pin also.

Should I wait for your controller interface before upgrading to the Blue Screen?

>
> The TT 565 LCD does not include a lcd controller and all timing and logic needs to be provided by the TT 565 embedded cpu. And as we can see, with every firmware release the quality varies up and down. I suspect the cpu does not have resources available at times which results in poor display timing.
>
> The PIC would become a special LCD controller (timed latch / flip flop) and targets to offer optimized timing and sequence towards the LCD regardless of what the TT 565 CPU believes is correct. THis way the LCD will be driven correctly and the quality would become independent of the firmware. This will also improve the original grey/white screen.

6455. Fwd: Update on Orion Firmware/software

Yahoo group: orion565 (2009 — 2013)
Date: 2010-11-30 01:28:33 UTC
From: Eric Rosenberg
Topic: 6455 Message: 6455

The following is from John Henry @ Ten Tec, who has given me permission to pass this along. It is part of an ongoing 'conversation' we've been having regarding ongoing TT support for its various radios.

73,
Eric W3DQ
Washington, DC

-------- Original Message --------
Subject: Re: Update on Orion Firmware/software
Date: Mon, 29 Nov 2010 11:37:45 -0500
From: Henry, John <jhenry@...>
To: Eric Rosenberg <ericrosenberg.dc@...>

Hi Eric,

Sorry for the delay in the response, been very busy both at work and with my father's hospitalization.

I am working on a schedule for the Orion 565 update, and the schedule for the high speed sweep board. They are like puzzles, they change when a new issue is found, or interface is realized, etc. The nature of the SW beast. But as soon as I can make them public, I will. A Jupiter update should occur this year, depends upon how the 565 and HSS go. I doubt an OMNI-VII update will occur for a while (at least not this year, probably part way through next year.)

I'm guessing the 565 update will be out to end customers either around Christmas or worst case part way into January. HSS, well, still negotiating cost/timing/etc. So I can't pass that on yet. But when that happens that will precipitate a 566 update and an OMNI-VII update to handle the new board.

Feel free to pass this information along, and I will formally update the reflectors on the status later this week.

73, John Henry

Onno,
WORKS GREAT!!!! This program is excellent for checking the connection.

thank you for all your time putting this together!

6459. Orion serial port testing: explanation

Yahoo group: orion565 (2009 — 2013)
Date: 2010-12-04 12:48:37 UTC
From: pa1ap
Topic: 6459 Message: 6459

Within the files section you can find the zip file "serial port testing". Just unzip within a folder and click on the setup icon. Internet access is required since microsoft modules might need to be downloaded. Installation will take a couple of minutes.

Usage;

The program will ensure all serial port settings are adjusted to what Orion needs. Even if in device manager the settings are different, except for Fifo since i could not find a way to change this through the program... I might find it someday.

When the program is started it will scan for available serial ports. With step one (1) you will need to select the correct serial port and click on "connect". When it finds the serial port being up it will run a test sequence to find out if an Orion is connected. If all goes well, Step two (2) will provide you with a status message and suggested next step. Computer status and Orion Status should turn green.

If you like to go a little further you can continue with step three (3) and step four (4).

Step 3 requires a power cycle on the orion while you keep the program running and connected to the orion. During boot sequence of orion, a message will be send by orion to inform the computer Orion is happy. However it does not confirm if the serial port on the orion is receiving something correctly.

Thats within Step 4. Step 4 you can test serial transmit on the computer towards the orion using the "toggle ANT1 to ANt2 button. You should hear / see the orion ant toggle when you push this button. You could also click on 10x and then it will toggle... yes 10 x :-)
You can also test the serial transmit and serial receive by using the "retrieve orion version"... If all goes well, the notification window will show the version of orion... and again you can do 10x.

there is also a slider within step 4 which can be used to test "performance"... by default it takes a 150mS interval for commands to avoid overloading the orion. You can test performance by turning it down to for example 100mS... If you click on 10x "receive orione verion" you should still see nicely TX, RX, TX, RX sequence. If you turn it down to about 80mS you will notice the TX and RX is not alternating anymore. For sure 150mS should give you nice alternation.

If you would go into device management on your computer you can select the serial port and go into advanced mode. This will provide you the option to enable FIFO buffers. I have found with other rigs that turning down the values will allow more reliable firmware loading when using fast computers but I have not found the best settings.

Hope this is of use for others when testing orion serial port.

Best regards, Onno pa1ap

Topic: 6462 Message: 6464

On the Orion II if you enable the filter through the menu system and it does not have an actual filter in the radio, you will not receive any signal (or it will be dramatically reduced). Very noticeable when you slowly reduce the band width and hit the spot where the filter was to kick in.

6465. Orion II , Model 566 , For Sale.

Yahoo group: orion565 (2009 — 2013)
Date: 2010-12-06 23:06:08 UTC
From: Dock (NMN) Edwards
Topic: 6465 Message: 6465

1..For Sale is a "Ten Tec Model 566 ORION II" Transceiver. It has the 1.8 Roofing Filter installed. The Original Boxes,Operators Manual,13.8 volts DC Power cable and an ACC Cable is included in this sale. The
W2ENY desk microphone comes with the radio for this price.
I'm NOW Asking ONLY $2,750.00 PLUS SHIPPING , This price is FIRM at this time.
Thanks for looking. Pictures can be seen on QRZ.com. Radio is in original box ready for shipping. Or $2,700.00 WITHOUT Microphone. It DOES NOT have the automatic
antenna tuner installed , but DOES HAVE THE 1.8 SSB FILTER. This transceiver looks and works real good in every way. This price is PLUS SHIPPING and INSURANCE. I will check the Actual rate for shipping to your address. Pick-up is
OK also.

6467. No output on meter

Yahoo group: orion565 (2009 — 2013)
Date: 2010-12-07 16:01:34 UTC
From: jskalski
Topic: 6467 Message: 6467

I have an orion that has no output. Actually it will tune and I can pick up a weak signal with another radio. I can also pick up my ssb signal.
the menu is set for TX on and the correct antenna is chosen. I reloaded the firmware in case there was a glich. Same difference. The output meter measures no movement.
I have a matched set of final transistors and I have driver transistors on hand in case.
Any suggestions on an approach?
I figure that I might disconnect the small coax leading to the final box and check the output at that point. Any idea what power level that should be?
Is there anyway to check the alc to see if that is working properly?
The tuner tells me that the swr is 1:1. (My first inclination was to bypass the tuner....but it seems to be working).
Anyone been there done that and can provide some pearls. I have test equipment. scope, freq counter, wattmeter, VTVM.
I just want to avoid wasting time if there are some simple fixes like a notorious bad cable or connector such as people have experienced in other areas.

Jim,
You may have said, but I just missed it, whether your Orion has an internal tuner.
If it does, even if it is disabled at the moment, you might want to enable it and run through one tune cycle. There is a condition where the bypass relay on the tuner gets "out of sync" so to speak, and the bypass relay is not energized.

As far as I recall, the 6Khz filter isn't a plug-in filter so not sure how you would replace it with their 2.8Khz filter. Not sure why you would want to anyway. The 6Khz roofing filter is fine for casual rag chewing at great bandwidths than 2.4Khz.

From: jskalski
Topic: 6479 Message: 6479

The process that I used to fix the 565 was:
Checked front panel to see that ANT 1 was selected.
Checked to see that TX was lit and on for VFOA
Menu items TX showed transmit enabled, Tuner enabled, Loops off.
Tested with and without Tuner enabled. Tuner would find a match but no output on meter.
Took off top and bottom covers and checked voltage regulators that were on boards and all were ok. 12v was available for final unit.
There was output at the TX 9mhz board out that fed the PA unit.
There was output at the XTVR output jack when that was enabled.
So at this point I was left with the PA unit and the cabling that supplied it and the antenna relay. The antenna relay I assumed to work because the tuner worked.

I kept the back panel on but unscrewed the heat sink/ PA enclosure and unplugged the coax from driver and output to tuner. I had checked the voltages to the LM358 keyed and unkeyed mic and they seemed to be ok prior to unplugging the cables.

I lifted two legs from one of the 2sc3133 driver transistor and hmmm
There was a short. Tested the other driver in the same fashion and it told me that "no component was found"....open.

That was encouraging. I replaced both 2SC3133 drivers with 2SC1945 transistors. They have the same foot print, pin out and similar gain.
3133 is rated at 14dB and the 1945 is rated at 14.5dB.
I have some 2SC3133's somewhere but can't put my fingers on them at the moment.

When I put the transistors in and replaced the wiring, I turned the radio on and nothing burned up. That is always a good sign :)
I set the radio to 5 Watts and keyed the microphone...success...
The output meter is bouncing around once again when I talk.

Now, I have a question for those that know what they are doing.
There is an associated trimmer pot probably for the bias adjustment.
What should it be set at while the transmitter is idling?
Where is the test point that the voltage is measured?

Hopefully this info is helpful for others in the same situation.
Happy holidays.
Jim n2go

From: amfone20000
Topic: 6484 Message: 6484

I have the Original Orion or Orion as opposed to the Orion II.
I do not have the 1.8 KC filter. I see it is $125.00 from Ten Tec.
I would like to know how this filter improves performance ,I just run SSB mostly with this rig and how easy/difficult is the install?

Thanks Tim

..... F Y I .....

this info is from Jupiter group and is dated 21 December 2010
paul k3sf

Updates

Please note that I have just uploaded firmware for the Jupiter. This release resolves the issue where AN and NR and NB turned on all at the same time would lock up the receiver in certain circumstances.

The Orion firmware update is still in process, and has not made it to the beta test team yet.

According to p42 of the manual, the AM tx bandwidth is double the SSB setting in the menu. So set the SSB bw to 3000 and you'll get 6000 in the AM mode.

Merry Christmas

I assume on AM transmit, the bandwidth will be twice the SSB Menu "TX Filter BW" (2 X 3.9KHzx = 7.8KHz max) but I'm not 100% certain of that.

I just did a quick check with a receiver and it looks like Orion AM tx bandwidth is limited to 6Khz (3Khz audio passband).

It's unfortunate, but the ssb tx audio passband is significantly wider than AM.

In any case, I always got excellent audio reports on our local AM net
with my O2.
It seems that the radio has a good AM setting by default, as per
factory programming, no needs of the usual heavy tweaking on controls
as found in many others solid-state rigs to obtain a decent AM
transmission.
Moreover, the receiver has very good performances even in AM.

If you read all the messages in this thread, we've discovered that the AM tx bandwidth is NOT double the SSB setting if the setting is 3100-3900hz. It's only double up to a setting of 3000hz. The Orion tx audio goes wider in SSB than AM.

I thought the original question was how to get a TX bandwidth of 6 khz. So I replied that a setting of 3000SSB gets you 6000 AM , which was what I found in the manual. If a particular radio is only doing 3000 AM with a setting of 3000SSB, then that's a different problem. Since I don't operate AM and don't own a scope to see what my Orion actually does, I'll sit down and let y'all work it out. Merry Christmas.

Date: 2010-12-25 17:51:01 UTC
From: HectorP
Topic: 6500 Message: 6500

My question to the group,maybe its very simple the answer but I can't find it.
I am a very happy owner of a TT Orion II and will like to run audio input to the rear AUX/IO connector,radio came with a cable with the DIN conector and four female RCA conectors on the other end,as the manual says,audio input should be conected to the white RCA conector which is pin 1. I just did it BUT the audio input level even its more than 1V from my laptop sound card,when I TX the radio makes only 5W meaning the input level gain is too low,nevertheless when I talk with the mic I see 100W.I set the TX Audio Source on BOTH to let mic audio and auxiliar audio both enter,I thought maybe there would be an audio input level adjustment within the menu but I could not find it.I made a temporarly solution until someone on this group help me out to find the cause of the problem and it was to run the auxiliar audio from the laptop to the mic conector on the front panel together with the mic passing trough an isolation 600 to 600 ohms transformer but that change mi mic gain a little bid which I expected to happen.I want to run the auxiliar audio trough the rear conector.
Any help will be appreciatted,thanks

Hector

My Orion the original has not had any upgrades. Are the upgrades worth it?

I do not have a 1.8 filter in mine. I run mostly SSB will it help?
Thanks Tim

I have all three installed. I use them during contests and close station QRM. I would have to say it depends on the ops radio habits and budget.

Hector,

There is an AUX Input Gain setting in the SSB menu. It is the first item in the list. This is the same menu where you select the TX Audio source.

I built an interface box that allows me to switch between a TNC and the computer for digital modes and keying. It also has isolation transformers on the input and output lines. I also have two potentiometers to adjust the input to the radio and the computer. I then leave the Aux input gain set at 100 and adjust the input to the radio with the potentiometer. Then all I have to do is select between the mic or aux input. The main reason I do it this way is because if I use software to do the switching as far as I could find there is no software command to change the Aux input gain, but there is to change the source.

Hope this helps.

According to p42 of the manual, the AM tx bandwidth is double the SSB setting in the menu. So set the SSB bw to 3000 and you'll get 6000 in the AM mode.

From: amfone20000
Topic: 6505 Message: 6505

Hello
I have an original Orion, so I called it the Orion 1. It has not had any of the TT upgrades nor does it have the 1.8 filter.

Will the upgrades add much in terms of performance? What are the upgrades for?

I operate mostly SSB, will the addition of the 1.8 filter add to the receivers performance in a noticeable manner in this mode?

Thanks
Tim

The Tentec 712 Soundcard USB interface handles all the chores very nicely. It' is a "plug-n-play" device. Connects direct to the computer USB port and the AUX connector on the radio. Levels are handled by the software in the computer and once set..... forget as it returns the next time one uses the application. No pots, no pads, no transformers, no humm, no problems.

One will have to change the audio source in the radio. Do note, please do not select BOTH as a source, for thus the computer sounds will likely be transmitted when on SSB and SSB noise from the mike will be transmitted when on digital modes.

I have always used for years these called "ground loop isolators" available on radio Shack or Wallmart for less than $15 and its the only way to avoy the hum on TX but my problem is that the audio gain at the accesory conector for line in is too low and there is no menu to increase it.
I was adviced few minutes ago in another email to buy the TT sound card to interface between the I/O conector and the USB port at my computer,if that fix the problem,I buy it.thanks

There are circumstances where isolation transformers are dictated in terms of use. This would be mostly where systems are required to be powered from two different power sources. In other cases, if an isolation transformer corrects a ground loop problem, then the proper solution is to find and correct the ground loop problem. If there is a ground loop, that usually indicates that two systems are not at the same reference potential. In certain cases, this can be potentially a dangerous condition and usually indicates that station grounding is not proper.

If the computer is operated from the same power source as the radio, thus the ground and neutral are the same for both, then there should be no ground loop. If the radio is grounded to one place, such as an outside ground, and the computer to the AC mains ground, this presents a very potentially dangerous condition, whereby a nearby lightning strike will present a difference in potential between the two grounds. Your computer and your radio being connected to these two grounds will find the difference in energy will flow through the radio and through the computer. Failure of one or both is highly likely. Devices such a sold by Radio Shack or Wal-Mart are by no means rated to handle this type of energy.

Find the ground loop cause and source and correct it. One other point, microphone inputs are designed in gain, impedance and headroom for microphone use. I do not suggest connecting anything to a mike input except a mike. Use the AUX input when and where available. If there is a gain issue, find it, figure it out and correct it such that it works properly.

The Orion does have a Aux Gain found in the SSB menu. Be sure to select Audio Source as Aux or Line.

See page 35 of the manual for transmit audio selections and gain adjustments.

The SSB menu is used for adjustment of SSB transmit options.

Aux Input Gain is used for adjusting audio gain from an accessory device using the line level aux input available on pin 1 of the rear panel AUX I/O connector."
TX Audio Source allows the radio to have audio input through either the front panel mic jack or via the AUX input on pin 1 of the rear panel AUX I/O connector. The available choices are MIC, AUX or BOTH. { I do not suggest selecting both.}

Signal level requirements are: Line-level Input: 6 dBm into 600 ohms for full output

In other words, 1 volt from the computer sound card should be more than adequate to drive the Aux Line input for any mode.

Hector,

There is an AUX Input Gain setting in the SSB menu. It is the first item in the list. This is the same menu where you select the TX Audio source.

I built an interface box that allows me to switch between a TNC and the computer for digital modes and keying. It also has isolation transformers on the input and output lines. I also have two potentiometers to adjust the input to the radio and the computer. I then leave the Aux input gain set at 100 and adjust the input to the radio with the potentiometer. Then all I have to do is select between the mic or aux input. The main reason I do it this way is because if I use software to do the switching as far as I could find there is no software command to change the Aux input gain, but there is to change the source.

Hope this helps.

73,

Bill

Connecting the unbalanced output of a computer or computer soundcard to the unbalanced input of the radio should pose no issue at all. Here's a good discussion on the topic from a noted authority on the subject.

http://www.jensen-transformers.com/an/ts_guide.pdf

Section 5 in particular demonstrates the ideal ground loop condition. Many of our ham installations employ this situation.

You should continue to use the isolation xfmr even when connected to aux in
on the rear.

Interesting article,but in practice,everytime I connect my Dell laptop to ANY radio audio input be at the rear or the front panel,when I input audio from the laptop either an MP3 or a digital signal like SSTV,there will be a significant hum noise unless I use as interface the "ground loop isolator" which is basically a 600 to 600 ohms transfomer in which case the transmited audio will be completeley clean with no hum at all.

I have all three installed. I use them during contests and close station QRM.
I would have to say it depends on the ops radio habits and budget.

I can't tell much about FW upgrades because my O2 is using one from 2006 although it works great with that one but about the 1.8Khz roofer my opinion is that its a must,without it is hard to reject the QRM from stations at only 2 Khz of your freq,you must install that one.

Hi Bill,yes your explanation helped me to solve the problem,I already had that box built but the input gain adjustment was missing for me,now I set the "Aux Input gain" to 100 and with the windows xp bar levels I set it up top the right level looking for same amount of modulation that when I talk with the mic,everything works fine now,besides you saved me the $75 that interface card would cost me at TT,what could we do without these groups? this is great to receive free technical advice from other users,have a happy xmas days left this year,73

Why don't you buy directly from INRAD,they have lower prices than TT ones,and the shiping is very fast,I ordered one for CW for 400hz last week and it arrived home in just 2 days,the price on TT of same filter was going to be $125 but with INRAD it cost me only $75,see that,the saving are substancial,buy new instead.

That's great! I know you will really enjoy operating it. My favorite setting is ON. HI HI. I operate CW 99.8% of the time and have all the filters installed. I will scan with the BW about 200-250 unless it is contest season. I normally operate in LCW. PBT, RIT and XIT at zero to start with. They would be adjusted if needed during QSO. Have a lifetime of enjoyment out of your new Orion.

I've been using the Orion for 7 years. Personally, I wouldn't put as much attention on reading what everyone else recommends. One reason is that much of that was written very early in the Orion evolution. AGC and gain setting changed fundamentally during 2004 with firmware revisions.

My personal recommendation is to load firmware revision 1.373b5, set your AGC threshold (RX menu) at 1uV or less, advance RF Gain till you can just hear band noise, and go from there.

Also, set cw rise/fall to 8 msec to avoid generating key clicks.

6528. 8-Pin Microphone Connector for Orion 565 with RFI

Yahoo group: orion565 (2009 — 2013)
Date: 2010-12-30 13:36:44 UTC
From: Edward A. Feustel
Topic: 6528 Message: 6528

I am in a high RF field environment when my Centaur
is on and apparently it is getting in through the microphone
on 80 producing distortion on the audio. I don't have distortion
if the amplifier is off.

I am considering replacing the 4 pin connector with an 8 pin
connector. I wonder if this would help and whether others
have done this. How should the connector be wired for
connections to 8 pin Ten Tec microphones?
Thanks and 73,
Ed, N5EI

6529. RE: [orion565] 8-Pin Microphone Connector for Orion 565 with RFI

Ed,

I can't quite see how having more pins in the mic socket will help. You might try an appropriate ferrite ring on the mic cable near the plug end .

Replacing the 4 pin with an 8 pin looks very difficult since the 4 pin connector is soldered to a pcb and the holes all line up. There is no way to fit an 8 pin without either cutting the pcb or drilling holes and adding wires. Better to add an external 4 to 8 pin adaptor cable if you wish to use microphones already fitted wth 8 piin plugs.

Regards

Martin

I have them for the Orion II, but I don't know if they are the same on the Orion. I'd have to fax or scan the document as I only have it printed. Lastly we could arrange phone call and I could take you through the options.

Might want to check to see that all pieces of equipment for the station
is bonded back to the ground terminal on the power supply for the radio.
Also, if you use an external "radio" ground, you may want to disconnect
that as well. At the same time, be sure that 3rd pin ground is used on
the power supply.

You didn't mention what mike you are using however you might try a
different mike to see if the mike might be the cause of the problem.
From my take, 4 pins or 8 pins, doesn't make any difference as long as
form, fit and function is retained.

> settings" for any of the bazillion parameters

The key parameter is the RF gain, especially compared to the Omni 6. The Orion sounds great if you turn up the AF gain and turn down the RF gain for comfortable audio.

Many of the other settings come into play in unique situations. The default settings are fine most of the time as long as you back off the RF gain.

The Orion is not a Cadillac, it's a hot rod. It needs adjustments and a firm hand to keep it under control. Did I mention backing off the RF gain?

You will enjoy learning how to control and get the most out of the rig in the coming months.

Hello

I have the original Orion. I have not sent it to Ten Tec for any of the upgrades, it is stock and original, with all stock filters. I have a few questions that perhaps the group can help me with.

What upgrades are available from Ten Tec and what benefit would I gain from getting it upgraded?

I operate mostly SSB with the Orion, would purchasing the 1.8kc filter for the Orion make much of an improvement.

Does anyone have a 1.8 KC filter for sale for the Orion?

Thanks 73

There are no "updates" that are necessary. You really only need a 1.8Khz filter if you do ssb contesting, and even then it's only of marginal benefit when there's an adjacent s9+ signal.

So all you really need to do is enjoy the Orion!

Having a little trouble reading what your saying to me. I think you note you had the original Orion but got the Orion II, is that correct?

In the original Orion you took out the 1.8 filter and have it to sell.

Is that right?

Thanks Tim

VFO-A in my Orion has developed a problem.When turning, frequency began to jump erratically and finally,when turning, frequency does not change at all.
I have the remote control pad connected and it works fine.
VFO-B works fine.
This problem appears on all band and at all frequency steps.

Look forward to hear comments from other Orion users.

I'd try re-seating all the connectors and cables coming from the VFO-A encoder. You'll have to take off the front panel.

It may not be a cure, but it's cheap to try....

Tom,

Press along the slopped area of the display window on the right side of the screen. There are a series of pins connecting the CPU and display boards to the front encoder board. In time they develop oxidation. The connectors are behind the menu through mode button. This will exercise the connection and things will start working again.

If you download the V2 mode instructions, you can see the pins and connector in the picture.

Happy New Year and 73,

John

From: Bob McGraw - K4TAX
Topic: 6522 Message: 6547

With regard to RF Gain, depending on antenna size, not necessarily those with more antenna gain, thus using an antenna with more capture area, I run the Omni VII at 30% to 35% on 160M, {full size antenna} and then progress upward {thus more RF Gain} as I move to higher frequencies. Thus on 6 M with a 5 ele yagi, PRE ON and RF Gain at near 100%. This seems to make sigs pop out of the noise.

I finally figured out with the new digital rigs, more RF Gain was not what made sigs readable as too much RF gain actually will make things worse. The Eagle performs the same way with the RF gain backed down to 9 o'clock or so for the lower frequencies and full size or larger antennas.

Regarding the Orion II that I had on the desk, I found to be a "handful" in terms of operation. I believe many hams found the Orion series to be more complex to operate to get optimum performance and just could not get a grasp for comfortable operation. Thus from their viewpoint they found it does not perform well.

Happy New Year to all and much good DX.

John,

"a firm hand to keep it under control"

made this pop into my head...there's a lot rolling around up there =0)

Jammin' gears has got to be a fever,
'Cause men become addicted to the grind.
It takes a special breed to be a truck drivin' man,
And a steady hand to pull that load behind.
Big wheels rollin' - big wheels rollin' - movin' on.

I have always turned down the RF gain, running the Orion at about 80%

A few comments:

1. Anyone operating a radio with analog rf/if stages feeding dsp if stage with the old mentality of maxing RF Gain and letting AGC take care of the rest is doomed from the start.

2. To this day, the Orion's reputation/mythology is burdened by all the complex receiver instructions written prior to December 2004. When firmware v1.372 was released, all the previous AGC and gain setting instructions were obsoleted and Orion rx adjustment became very simple.

3. v2 firmware requires more careful gain adjustment than v1.372/1.373 firmware.

Barry:

Great comments and summary.! Thanks. I've been trying to get that said for many months with radios like the Orion, Orion II, Omni VII and now the Eagle. Your point #1 is absolutely spot on.

Happy New Year!

I have an Orion with a blinking display. It is not blinking all the time but sometimes is annoying. Contrast is at 50%.
What might be the problem?
Other than that it is a great radio.

Adi, Yo2liw

Subject: Re: [orion565] Re: New to Me Orion One

I have had my Orion for close to 10 years now, and I still love it. it took me a month or two to figure it out and another 6 months to really perfect my skill, but here is a brief.

start with a global reset so all of your adjustments are from a good start. I usually run the preamp off and the rf gain at 80% or so and the volume comfortable .I find The mic gain at 40 or so and start with most of the menu items as reset.

Then when you are "used" to this setup play with one setting at a time and see how it changes. some you will need to change right away like under menus you turn on the filters you have, set the sidetone pitch where you like it, enable the tuner if installed and such.

I find in a SSB contest I usually end up with the band width at 1800 or 1900 cycles wide, and the band pass set up about 400 cycle so I am listening to a narrowish ssb signal now centered between 400 and 2200 cps, which knocks off interference from adjacent stations. I seldom use noise blank or noise reduction. I use a remote vfo, which is handy, and I run a winkeyer usb for keying and do not use the internal keyer, but it works fine.

realize I also have a FT990, a TS2000 an FT847, a couple of ft 857's a pegasus, a 746 pro and a flex 1500 in the shack. I use the orion 95% of the time. it is that good.

so play with it, make it yours, and give it a little time for you to sort it out.

Tom

Gentlemen,

Your suggestions did work.
It clearly appears that dissimilar metals used on both parts of connectors is the problem.
After flexing the front panel on the right side of the screen everything is back to normal.

Regards,

Tom, VK2OE

most likely the dc-dc regulator board capacitors which need to be replaced. In my case i had to replace them as well replace the contrast potentiometer since there was a crack in the resistor path. Best regards, Onno

Pleased to be on this reflector. Just traded my K3 for the O2. I have licensed since 1959 with a 20 year hiatus. I am a Collins collector with 31 pieces of Collins. I still have my original 75
A4 I acquired in 1959.
In the shack-a construction trailer-is a FTDX9000MP. I will drive an Alpha 99 with the O2 if needed. My antennae are SteppIR BigIR on 80-6 and the SteippIR 4element with 30/40 addon mounted at 65 feet.
My primary operation is rag chewing. Some DX, a little contest for fun.
While the K3 is a good rig, it just wasn't my cup of tea. At Dayton, I took a serious look at the Orion II and with the encouragement of a buddy decided to try the Orion.
This reflector has already giving me several tips on operating.
Looking fowared to meeting many of the Orion users.
BTW, I have visited the Ten Tec plant in Sevierville. Impressed only I wish they had a better antennae-might have bought one earlier.

I currently own a Ten-Tec 538 Jupiter and am looking to upgrade to another Ten-Tec radio. My interests include SSB contesting, Digital Modes ie PSK31, SSB DX, casual CW contesting, some CW DX and ragchewing. I am 60 yrs young and computer technology savy and retired. I expect the radio I buy now will be my last for me so I am looking for recommendations. I plan to stick with Ten-Tec, so, Omni, Omni II, Orion VII, Eagle? I am open to new or very good used rig. The only other rig I have even considered is Elecraft's K3 but I'm really partial to Ten-Tec.

Please help me with ideas for my "last" HF rig.
73,

Mike NT5DX

Mike: FWIW I had a pair of TenTec Orions. My first one was one of the first off the production line and like you I thought it would be my last hf radio. I never did like the Ver 2.x firmware and hung on to ver 1.373B5 until the end.

Well fast forward a few years. The Orions have gone to new homes and my K3 is without question the best I have ever used. The first month after I got the K3 I thought I had made a mistake, but that was short lived. I still have some TenTec radios, as they are collectors items on my shelf but the one I use is a K3. The second receiver, and receiver performance in ALL areas is vastly superior to the Orion. Sorry, but you asked for opinions. Enjoy whatever is your "last" one. By the way I play about 99% of my radio time on cw. 73 bob de w9ge

I bought an Orion for my "last" main rig. I have all the filters installed in mine. I enjoy the ragchew but also play in the contests and working the DX stations. The second receiver really helps for working the split operations. I plan on retiring and growing old with this rig. If I were to upgrade in the future it would be the Orion II without question. You could call the sales department about a trade in for your Jupiter.

Mike, I think you'd be happy with the performance of either an Orion or a K3. I have one of each and use them both regularly.

If you want to stick with Ten-Tec, I'd definitely go for a used Orion.

BTW, I don't agree with the statement that the K3 main receiver "performance in ALL areas is vastly superior to the Orion". I'd say that it's neck-and-neck between the K3 main rx and the Orion main rx. Of course, the K3 subreceiver IS vastly superior to the Orion subreceiver.

Topic: 6561 Message: 6569

My on air listening experience indicates that the K-3 transmit audio is average. One that I hear regularly does not sound near as good as many other radios. I've experienced two K-3's that I assembled. I found that listening to the receive audio was fatiguing. I presume this to be due to the higher percentage of distortion in the receive audio.

For a good all around performance vs. feature radio, the Omni VII is hard to beat. The Eagle has an outstanding receiver, the radio is very easy to use and has both great receive and transmit audio.

From a radio vs. model point of view, the Eagle is like an economy car, it's good on performance and easy on economy, the Omni VII is more like a sports car, looks good, performs well and is something to be proud of, while the Orion II is more like a Indy 500 car. It gets the job done and is often out in front of the pack but takes a skilled driver to accomplish such.

Bob,

How about a comparison of the original Orion 565 and the Orion II 566?

The superiority of Orion's close-in cw performance makes it a clear favorite over the Omni 7 in my book.

The rx audio quality of the Orion is superb.

I have got to weigh in on this subject. Like Barry I too have owned both the K3 and the Orion II. I used the K3 for one year before I purchased my Orion and after six months of owning both side-by-side I sold the K3. Unlike Barry I really did grow to dislike the K3 audio on ssb. I find it too harsh. I even tried the new board to see if that fixed the sound. No in the end it was just not the radio I wanted to sit and listen to. My other complaints about the K3 came down to ergonomics and especially that menu system. I never grew comfortable with them. I always needed the manual to be certain that I knew what I was changing.

The Orion is not without its flaws, it certainly needs some time to learn its quirks but I personally find it much easier to live with on a day-to-day basis. Menus are easy to understand, the receiver is amazing (as was the K3's) and once you realize that RF gain must lowered and the use of the agc the sound is simply very nice.

Just my 2 cents worth,
Bruce

I've never had both on the desk at the same time. My recall is not such
that I'd care to comment.

I see several other comments on the reflector that do make comparisons
between the two, specially with V1xxx firmware and V2xxx firmware.

No news and 565 has not been abandoned. I believe John Henry's last posting
on the topic suggested that beta firmware might go out this month.

Well I think I will throw my 2 cents into this. I use mainly CW and SSB. I have both an Orion ll and a Elecraft K3 fully loaded on both. I disagree that the audio quality is not good on a K3. The reason some k3's do not sound good is due to the operator and not the radio. I think you must use good speakers and a good microphone and that you need to know how to adjust the equalization of the transmit audio to get the desired results. Both radios are outstanding radios however, the K3 seems more state of the art and gets lots of firmware updates on a regular basis. The Orion is easier to learn than the K3 IMHO. The second receiver in the K3 is by far much better than the second receiver in a Orion ll. Customer service is good on both radios and considered outstanding as provided by Elecraft. I use top quality microphones on both, a Heil PR30 on the K3 and a Electrovoice RE27ND and W2IHY boxes on the Orion ll. For speakers I use Voicemaster Pro communications speakers. These additions yield outstanding audio. No audio boxes are needed on a K3 as it already has 8 band equalizers for both transmit and receive built in. I think both of these would be a good choice and its really a matter of your own preference and comfort level. But with either radio you should plan on adding some add ons to get top quality audio performance.

?I recently hooked up a big Hammerlund speaker to my Orion 2. The speaker had sitting unused for a very long time. It really makes a difference in sound quality compared to the dinky up firing speakers that are built into today's ham radios.

And why not to add 2 cents more to this very interesting topic,I also own a K3 for more than 2 years and purchased recently a new Orion 2 and after using it for a month now,I backup 100% your comments about audio quality been better on the Orion,that is not true at all,I think is more a subjetive comment than the reality,I analyzed both radios received audios with a spectrum analyzer and both have almost identical well balanced audio response from 40 to 5000Hz,there is not a difference between them,I use the same type of hi-fi speakers with both and they sound excellent.One thing to remember is what is been said,you must have a good speaker system capable to respond at same freq range.For TX I have a Behringer electret mic and from same brand the preamp/phantom power box and after both radios has been equalized with their respective builtin EQ the audio freq response curve is also almost identica,only difference is that the roll-off on the Orion starts on 60 Hz while at the K3 starts at 80Hz of course that is with my own voice,all those graphs can been seen at qrz.com under my call sign.
Both radios has excellent performance although I have noticed that the O2 receives less noise than the K3 and certainly the second receiver on the K3 is way superior than the one at the O2.
I think these two radios could shake hands side by side and live together as twin brothers.

Well I think I will throw my 2 cents into this. I use mainly CW and SSB. I have both an Orion ll and a Elecraft K3 fully loaded on both. I disagree that the audio quality is not good on a K3. The reason some k3's do not sound good is due to the operator and not the radio. I think you must use good speakers and a good microphone and that you need to know how to adjust the equalization of the transmit audio to get the desired results. Both radios are outstanding radios however, the K3 seems more state of the art and gets lots of firmware updates on a regular basis. The Orion is easier to learn than the K3 IMHO. The second receiver in the K3 is by far much better than the second receiver in a Orion ll. Customer service is good on both radios and considered outstanding as provided by Elecraft. I use top quality microphones on both, a Heil PR30 on the K3 and a Electrovoice RE27ND and W2IHY boxes on the Orion ll. For speakers I use Voicemaster Pro communications speakers. These additions yield outstanding audio. No audio boxes are needed on a K3 as it already has 8 band equalizers for both transmit and receive built in. I think both of these would be a good choice and its really a matter of your own preference and comfort level. But with either radio you should plan on adding some add ons to get top quality audio performance.

Oreradioguy,
Perhaps your hearing is not what mine is but I know what I hear and I know what I like. I do not like the audio of the Elecraft K3. To suggest that I am somehow in error is a pretty bold statement. Just for the record I use both external speakers and headphones. Numerous examples of both and I could not find a combination that I felt helped the obviously inferior (for my tastes) audio of the K3. Some people think that Bose audio is the best, I can't help that. Some people say that speaker wire makes no difference; my answer is that if you can't hear it, don't buy it. Please though don't tell me that because you can't hear what I do, I must be wrong or worse not understand what I am hearing. I really wanted to love my K3, I built it from a kit, I studied the manual, I bragged about the receiver's performance, I read the reflector and I just lived and breathed the K3. In the end the audio gave me a headache even after replacing the DSP board with a rev C version. I am fine with the idea that other people hear it differently than I do but to suggest that it is somehow my lack of understanding is just ...really thoughtless.

I have a K3, Orion II and Omni VII. I too think the TenTecs sound much better! (My K3 has the old DSP board in it though.)

I have used many different speakers (Bose Companion II, Klipsch Promedia 2.1, Klipsch Heresy, Minimus 7, Sounds Sweet, Icom SP20, and more) To me the TenTecs sound better no matter which speaker is used, no matter what adjustments were made on the K3. The TenTecs just sound GREAT. The TenTecs sound better via headphones too. I use a set of Sony MDR-7506s and the TenTec Model 777 DX PRO headset.

I don't plan on getting rid of the K3, it is a very nice radio for sure. But.... If I were forced to get rid of one, the K3 would go.

I think it is hard to beat the TenTecs. Performance, ease of use, quality of signal (received and transmitted) etc....

I'm in the process of updating my K3. When it's finished, I'll try and produce a high quality A/B recording of K3/Orion after carefully matching the passband responses. It would be an interesting experiment to post the recording and let everybody listen blindly and vote on whether rig A or rig B sounds better and describe what the perceived differences are.

6582. Re: [orion565] TenTec and K3 audio.

Yahoo group: orion565 (2009 — 2013)
Date: 2011-01-11 03:06:18 UTC
From: Bob McGraw - K4TAX
Topic: 6561 Message: 6582

Someone commented about frequency response of the audio systems as related to the sound of various radios. Although any two systems may be spectrally identical, other factors contribute a significant portion to audio system performance and largely what we hear. Those are: THD+n, amplifier slew rate limiting, damping factor of the amplifier output stage, and intermodulation distortion just to name a few. A simple spectrum analysis with regard to frequency response is far from a complete measurement for comparison.

With regard to using "hi fi" speakers on ham radios, typically the audio stage of a ham receiver does not have an adequate damping factor for most speakers of this type. This usually presents itself as a sloppy or loose bottom end sound. Amplifiers that contain a reasonable amount of 3rd and 5th order harmonics sound musically better than amplifiers containing 2nd and 4th order harmonics of similar magnitude. Amplifier stages with slow slew rates will cause higher frequencies to be muffled or muted although frequency response will remain largely flat to the limit of the upper limit of the amplifier. In many cases, an amplifier that does not have a flat frequency response may actually sound more pleasing. After all, our ears do not respond uniformly with regard to frequency vs. sound level. And then finally the acoustic environment in which one is listening contributes as well to the overall sound.

Audio is much more complex and involved than many think or understand. But hey, it's only audio.

6583. K3 audio quality against the O2

Yahoo group: orion565 (2009 — 2013)
Date: 2011-01-11 03:39:34 UTC
From: HectorP
Topic: 6583 Message: 6583

here is a link where I have dozen of MP3 files of recordings I have done with my K3 where you can judge by yourself if a K3 sounds bad or not:

http://www.ad4c.us/Elecraft%20K3/shared%20files%20from%20K3%20users/AD4C%20recordings%20on%20his%20K3/

copy and paste it to your browser and hear some of them or all and I am sure you will agree that a K3 sounds as well as an O2 and If you think it won't then I advice to go to see your ear Dr.

It is obvious that you are much more versed on the subject than myself Bob.
I would like your recommendation on what speakers are most suited to ham
radio transceivers.

That largely depends on ones objective. If communication quality is the objective then I'd suggest one of the commercial speakers typically used with Motorola or GE mobile radios. They can be found at hamfests and swap meets for $5 to $10 depending on model and condition. I specifically like the GE Mastr Pro series. They have limited frequency response on both the extremes of low end and high end thus automatically eliminating some of the unwanted noises. As a result of their efficiency, they can produce quite high sound levels without any additional amplification.

If you want a wider range speaker system, I suggest a wooden enclosure of 1/4 to 1/2 cubic foot in volume fitted with a 6" to 7" two way speaker typical of the door mounted speakers found in autos. Load the box with bat fiberglass material, port the box at 1/16 to 1/8 of the speaker square inch value. These speakers are designed to be driven from 12 volt auto audio systems with typical power amps found in both auto radios and ham radios.

It is obvious that you are much more versed on the subject than myself Bob. I would like your recommendation on what speakers are most suited to ham radio transceivers.

Agreed Bob. I'm suggesting using line-level recovered audio for rig comparison purposes. I mentioned matching passband response in the test setup phase to take passband differences out of the equation for A/B listeners to discern differences/preferences. The passbands of the K3 and Orion are easily adjusted and can be closely matched.

I typically use quality externally amplified speakers anyway - audio output stages in hf xcvrs are almost universally mediocre.

Yes, the line level or AUX output will most likely always produce the best quality audio. That needs to be sent to a good quality audio system or computer soundcard and speaker system.

The area of concern is the audio output stage of the radio and the acoustic interface between the speaker in the radio and the associated space and effective damping in the case. Usually and best described as a small speaker mounted in a metal box with a lot of hard stuff inside. At higher volume levels, output stage distortion, case vibrations and internal rattles contribute to basically distorted sounding audio.

Many radios do not have clean audio output stages and this is largely due to the limited value of power voltage available. The use of output stage internal feedback does contribute to improving the deficiency of the system. The audio output stage performance is easily identified in the published specs or by the ARRL Lab Test results. Just look for the rated output power in watts vs. load impedance {4 ohms} and the resultant distortion product expressed as a percentage. Basically more watts and less distortion is preferable. Even armed with this info, nothing is exposed with regard to how the speaker system performs in the application. Using a suitable external speaker will likely make a nice improvement to the sound.

From: k1fpv
Topic: 6561 Message: 6591

I have to agree with you Tom! I feel that way and also use seperate, front facing speakers on all my radios. Counting QRP as well as larger radios including my Orion II, I have 10 radios, all with seperate speakers facing forward.

My 2¢ worth!
Bill/K1FPV

6592. Any Orion II diversity users out there?

Yahoo group: orion565 (2009 — 2013)
Date: 2011-01-14 23:22:22 UTC
From: Barry N1EU
Topic: 6592 Message: 6592

If any Orion II owners out there frequently operate the rig in stereo diversity mode please drop me an email off list. I'd like to compare notes.

Thanks & 73,
Barry N1EU

From: Barry N1EU
Topic: 6561 Message: 6594

Okay, let's put this audio discussion to a test. For anyone game - please
listen to these files:

http://n1eu.com/riga.mp3
http://n1eu.com/rigb.mp3

(sorry about the qrm on first half of riga.mp3)

They're recordings of KW6LA essb signal on 17M through the K3 and Orion with
about 3.4Khz passband and AGC off.

Please send me a private email expressing your opinion on whether one sounds
better than the other and which one. If someone would like less compressed
(i.e., larger) mp3 files or the original .wav files, just let me know.

73,
Barry N1EU

6595. Re: [orion565] TenTec and K3 audio.

Yahoo group: orion565 (2009 — 2013)
Date: 2011-01-15 23:33:26 UTC
From: Barry N1EU
Topic: 6561 Message: 6595

Thanks for the responses I've gotten so far. I looked more closely at the two recordings through spectrum analysis software, and I must report that I suspect KW6LA might have switched EQ or microphones on his TS-870 tx audio between the two recordings ;-(

So that makes an A/B test questionable. I guess the revised question I'd like to pose to listeners is: do either of these recordings sound objectionable in any way and if so, which one and how so?

Some folks have described the K3 audio as harsh, fatiguing, etc compared to the Orion. Are you hearing hints of that in either of these recordings?

Thanks & 73,
Barry N1EU

"Some folks have described the K3 audio as harsh, fatiguing, etc compared to
the Orion. Are you hearing hints of that in either of these recordings?"

NO way !! nothing more far than to be harsh or fatiguing,those two recording are nice,clean,smooth,that guy sounded very well in my laptop trough my Yamaha CM500,I actually did not noticed any difference between them,the recordings were done very well,so its out of the question that the K3 sounds bad.It sounds as good as the O2.

Thanks for the responses I've gotten so far. I looked more closely at the
two recordings through spectrum analysis software, and I must report that I
suspect KW6LA might have switched EQ or microphones on his TS-870 tx audio
between the two recordings ;-(

So that makes an A/B test questionable. I guess the revised question I'd
like to pose to listeners is: do either of these recordings sound
objectionable in any way and if so, which one and how so?

Some folks have described the K3 audio as harsh, fatiguing, etc compared to
the Orion. Are you hearing hints of that in either of these recordings?

Thanks & 73,

Thanks, keep the responses coming!

I just want to reiterate my last email - please don't just say you prefer recording A over recording B. After looking closely at the recording spectra, I'm fairly certain the operator changed his TX EQ or microphone between the recordings - there is noticeable difference in the bass and upper midrange. So saying you like A over B is really just saying you prefer one TX EQ over the other.

Please listen closely and say whether you hear anything harsh, objectionable, or fatiguing in either recording.

I'll reveal which is which sometime in the next 24 hours.

6598. Re: [orion565] TenTec and K3 audio.

Yahoo group: orion565 (2009 — 2013)
Date: 2011-01-16 04:45:16 UTC
From: Bob McGraw - K4TAX
Topic: 6561 Message: 6598

This is not an issue of the recording or the audio coming out of the line outputs of the radios. The general fallacy is the method does not capture the audio power amplifier stage and how it responds to the speaker and how the speaker responds in the radio cabinet. Audio recordings from the line level output will not capture this phenomena.

These recordings were from the headphone output of both radios.

6600. Re: [orion565] TenTec and K3 audio.

Yahoo group: orion565 (2009 — 2013)
Date: 2011-01-16 12:35:32 UTC
From: Barry N1EU
Topic: 6561 Message: 6600

Thanks to everyone who participated. Like I said, it was a flawed test and perhaps I'll do new recordings splitting the antenna and recording simultaneously on both radios.

Despite the flaws, I find it interesting. I would have guessed that there wouldn't be much of a preference between the two. But to my surprise, there was a significant preference expressed for rig A:

6 votes for rig A
1 vote for rig B
3 no preference

Yes, rig A was the Orion and rig B was the K3 (with all audio/dsp updates).

Thanks again & 73,
Barry N1EU

From: Bruce
Topic: 6561 Message: 6601

I've said it from the moment I first turned on my Orion II one year ago today, this is what I'm looking for. I never looked back, sold the K3 and I don't miss it.
The other radios I liked listening to where the Kenwood TS-590 and the Yaesu FT DX 5000. I had just a short time with each but it seemed that the audio was nice.
I really need to find a smooth old tube radio to play with as I understand that some of these represent the ultimate in audio, hmmm, might be interesting.

Bruce if you want to experiment with old tube type radios that have a good audio quality you have no choice other than to buy yourself a Collins,be a KWM-2A or the matched pair of 75S3 RX and 32S3 TX,I owned them many years ago and they had very sweet clear smooth audio in spite of no tools at all to fight against QRM.

I've said it from the moment I first turned on my Orion II one year ago today, this is what I'm looking for. I never looked back, sold the K3 and I don't miss it.
The other radios I liked listening to where the Kenwood TS-590 and the Yaesu FT DX 5000. I had just a short time with each but it seemed that the audio was nice.
I really need to find a smooth old tube radio to play with as I understand that some of these represent the ultimate in audio, hmmm, might be interesting.

Hector,
You are no less than the 3rd person today who has mentioned that I should try radio! I can feel a new acquisition shaping up here. The only problem is that I am right in the middle of a new tower/yagi installation and my "radio budget" is pretty severly depleated. I'll begin with a little on line education as I think I'd like to play with one.

Well then finish first your project with the tower and beam antenna and when that be done,start saving some extra bucks to buy a Collins radio,I will recomend the KWM-2A but be aware those are antiques very much wanted all over the world specially by the JA hams so tnat means their price is high,always over a thousand bucks,just check daily on qth.com under the section "HF radios" and you will see almost none but when they show up the price is high.One of the radios in the world that are the most quite are Collins,you will love them.Good luck,73

Hector

6605. Which one? Orion or Eagle

Yahoo group: orion565 (2009 — 2013)

From: pulsekeeper1
Topic: 6605 Message: 6605

I am contemplating what my next rig might be. I would appreciate feedback from the group given the price of a used Orion vs an Eagle and the performance and features of each. What are your recommendations?

Charlie -

Impossible to answer. Car metaphor - Would you rather have a nice high performance sedan (Eagle) or a sophisticated long-haul semi tractor with tons of gears, controls, capabilities (Orion)? One is easy to use, the other is more capable in particular situations, but needs a skilled driver.

Since you are asking, I'm assuming you don't need or want that sophistication. Go with the Eagle.

☐Charlie,

I have the Eagle as well as 2 Orion 2s. All are GREAT radios! So the answer depends on what you plan to use it for. If it is your main home station rig, Orion 2 should be the choice. If it is a back up rig or a mobile rig then the Eagle should be the choice. The O2 has more filter choices and bells and whistles and the firmware is very stable. The Eagle is new, has less filter choices and has a receiver to die for like the O2 main rcvr. The O2 sub receiver is fine for an up conversion receiver, but it is NOT the equal of the MAIN O2 receiver. The Eagle only has an excellent main receiver.....no sub receiver.....but it is less expensive!!

This has all been great food for thought. I do not contest other than give contesters a contact. I do like to chase a little DX and ragchew. I do not forsee operating remote or taking it to field day and seldom have any guest operators. I still have my Omni 6 option 3 but would like to do a little update. I do not work 6 mtrs. I will do some digital and am looking to restart CW after a 30 yr. sleep. The new baby stays at home, the Omni 6 can deal with the field and play backup.

Man,that is not a brainer,of course the best radio among those two is the Orion II in all aspects,better selectivity,second receiver,better audio quality,etc etc etc,you can find a decent O2 used without a tuner at qth.com for around $2700 to $3000. I got mine last month,like mint condition with no tuner but all the roofers and a nice base mic for just $2750,go for it !!

Except for the color display and six meter coverage, is there really that much difference between the Orion and the Orion2...? { Plus, the Orion can be easily modified to accept V.2 firmware. }

Jim et all:

I purchased an Orion several weeks ago and after playing with the Orion for a few weeks, I just ordered and received an Orion II. If you blindfolded me, so I couldn't see the display, I'd have a hard time telling if it was the Orion or the Orion II that I was using. It is a top drawer transceiver and not at all hard to get to know. A good used Orion with all of the optional roofing filters can be had for the same or less than the Eagle. I would say that there is no (absolutely NO) question which one I'd spend my money on! - Larry W8ER

6616. Re: Which one? Orion or Eagle

Yahoo group: orion565 (2009 — 2013)
Date: 2011-01-18 17:15:26 UTC
From: pulsekeeper1
Topic: 6605 Message: 6616

My thanks to all of you for the time and consideration you took to answer my question. I believe an Orion or Orion II would better serve me for what I have in mind. This will be a rig for the house and one I can grow with. Although, I live in the country now I am expecting to move back into the city environment with many hams in close proximity of each other. I read the manual for the Eagle and I would dearly miss the band stacking registers which I use more than the regular memory locations and the spot feature is nice. Also, the many antenna configurations are very helpful. I think the Eagle would make a fine pinch hitter but falls a little short as a main event. In the long run I would long for many of the options and features the Eagle do not have and would end up buying again anyway. I think the Orion and Eagle groups are fantastic resources and I have been a Ten-Tec fan since my first new rig an Argonaut 509 in 1977.

Thank you again,
Charlie, WE4CW

6617. Orion 565AT firmware update

Yahoo group: orion565 (2009 — 2013)
Date: 2011-01-19 12:24:30 UTC
From: AC2FC
Topic: 6617 Message: 6617

Hi groups,
I just start with my Orion 565AT.
I have installed firmware version 1.373 and I want to upgrade to v2.062 or 2.063. My first question is witch version is better v2.062 or v2.063(betta).Secound question is - do I need to make a "Orion V2 logic mod" (like ten-tec said on they website)before upgrade firmaware?

Thanks Arek
AC2FC

Congrats on the new radio Arek! My understanding is that you can run v2 firmware without the mod. However, the sweep won't function in v2 unless you perform the mod. Personally, I NEVER use the sweep.

6619. Dimming of Display when keying

Yahoo group: orion565 (2009 — 2013)
Date: 2011-01-19 14:22:27 UTC
From: Heinz Meier
Topic: 6378 Message: 6619

Hallo Orion users,
Some weeks ago I`ve got an Orion 1. It was announced to be full ok.
But as I switched it on , I saw the display was a little dark
and was reducing its brightness during transmission.
After a discussion with the former owner i was looking for the reason.

Then I studied the schematics and made some measurements :
1. The power voltage +13,8V is absolutly constant on my power supply, but inside the Orion ,
it can be measured by following the power circuitry, the power voltage is varying in dependency
of loading the rig.(between 13,7 to 12,7V no load to full load).
In the net can be read something about this.
I thought, this small power voltage drop could not cause the display flickering if
the display-voltage would be stabilized in the Orion.
Neither the Orion connectors nor the fuse should be the problem with my Orion.

2. The Display Voltages -22V and +5 Volts , i found, are generated in a switchmode
power supply on the " power distribution board A9 " .
On my board the -22 V was stable, but not the very sensitive +5 Volts.
Its varies very much from 5 down to 4.4V under load or input voltage changings.
This was the big bug and causes the displays brightness varyity and something else.
The voltage can also be measured outside the rig on the rear remote connector pin8 to Gnd.

At first, I tried to get a new board . But it wasn`t on stock available at Ten Tec.
Then I found some information in the net and had read what has happend before with some failures around the display.

But changing the recommended board-capacitors on the A9 brought no better results.
Then I saw a difference between the TenTec board schematic and the circuitry on my A9 board:
On my board the upper PNP -transistor was not the original type TO220P "NTE 378".
Ten Tec had used -how long?- another type BD246C .

Because this one is a TO3P Type(bigger) and not fittable onto the bord , it was mounted very carefully- like production people do it-
via 8cm long wires beside the A9 board on the al -case.

I am very sure this outsourced transistor has worked in my Orion since it has left the production. (Serial Nr. 10C 10584 in 2005)

I ordered- over night- the original NTE 378 from a semiconductor dristributor, placed it next morning within 15 minutes directly onto the board and it worked perfectly.

see http://www.qrz.com/db/DJ8LX

The +5volts are now stable under all conditions and the Orion works very well.

The reason for this unusual unstable +5Volts was the kind of assambly via the too long wires.
The BD-transistor wasn`t really faulty.
The datas of BD and original NTE 378 are only slightly different, but I would in any case prefer

the Ten Tec development design with the matched complementary transistors on the A9.

Extended cable lengths and the coupling beetween them had reduced the control capability of this

switched mode supply.
But in any case the max +5volts value limitation has worked,because the circuitry could reduce

its frequency under low load conditions (receive, standby, power voltage high, e.g.).
But wasn`t able to keep it konstant if it`s input-power voltage dropped under keying load conditions.

Now I an very happy with my Orion, it´s an excellent rig.

best 73
Heinz, DJ8LX

The Orion has CW and voice memories, the Eagle does not. I've found these memories very useful in contesting, and can operate 99% of a CW or Phone contest with only the Orion's Send1 and Send2 buttons. Also very nice for late night operation where you don't want to disturb others.

When I learnt that the Eagle doesn't have separate RX input I totally lost interest in this radio.

You brought up a very good point Russ concerning the voice and CW memories. I had forgotten about them since the last time I had used any I had a Kenwood TS-850s. It was great during FD and other contest.

6624. Heil mic for orion 565

Yahoo group: orion565 (2009 — 2013)
Date: 2011-01-20 18:33:27 UTC
From: AC2FC
Topic: 6624 Message: 6624

Hi group,
I am looking for any opinion and recommendation wich Heil microphone is the best for orion 565? HM-10dual ? GM-5.1? PR-20? HM5 or HM-PRO? or maybe PR-781? I am not looking for " super" Hifi SSB effect but i want to have nice clear signal.

Thanks for any opinion

Arek AC2FC

Arek:

I have tried several microphones on both the Orion I and the Orion II. I think that what I found will hold true for other radios (Jupiter, Eagle, etc.). I won't go through an entire list but a couple of the ones that I have tried are the Electrovoice RE-20 ($400), Shure SM-58 ($100) and the microphone that everyone that I talk to prefers is a Shure SM-58 clone, made by Behringer and it is their model XM-8500. I tried and recorded every audio setting on the radio systematically. In addition to the mic input, I tried these microphones using an outboard Symetrix 528E and going into the line in input.

All considered, you will be hard pressed to find anything that outperforms the Behringer XM-8500 going right into the mic input on the front. I just bough a pack of three of them on Ebay for $49.95. They can be had for about $20 each in quantities of one. They have a die cast body and are very solid. I think you could drive nails with them!

Others will undoubtedly disagree with my findings because how what sounds like is very subjective. Save yourself a lot of trouble and money doing what I just did and grab a Behringer XM-8500 first. If it doesn't work for you, it's only $20. I would be glad to send you the settings that I use on the Orion, if you like. I believe that they should be very close for most installations. Good Luck!

WELL AREK,IF YOU ARE NOT INTERESTED TO HAVE ESSB SOUND QUALITY THEN ANY HEIL MIC WILL WORK FINE,BUT IF YOU WANT TO HAVE "LOWS" WITHIN YOUR PASSBAND,THEN YOU WILL HAVE TO CHOSE PR-20,30,40,781,ETC ANY OF THOSE WILL COME DOWN TO THE LOWS RADIO CAN TRANSMIT.
LIKE I SAID IT ALL DEPENDS HOW YOU WANT TO SOUND.

6628. Upgrade advice and help to fix Orion 565

Yahoo group: orion565 (2009 — 2013)
Date: 2011-01-20 22:50:18 UTC
From: itoplician
Topic: 6628 Message: 6628

Hello dr OM's

I watch this group from some time and I consider it is a valuable resource.

I also have a dilemma.

I want to upgrade from FT-2000 to a better CW rig. My plan was to sell the Yaesu rig and to buy o basic K3 but with the economical crisis on my country not to many will be able to spend about 1800Euro on a rig (will be a time consuming).

Anyway, before winter holidays I received a Ten Tec Orion (565) with all the roofing filters and Ten Tec 963 power supply, from a friend who doesn't seems to use it a lot. After some struggle with the rig I guess I can handle with the operation and it is a good rig with a lot of features and a joy to work CW which I do like more. At first FT2K sound way better on CW and SSB but working with AGC variables result now in a positive difference for Orion.

Usually I prefer to watch and listen to the rigs I want to buy but there is no K3 in my area, so I am a little bit confused with my choice. Despite that I encounter several problems with the Orion.

1. Display flickering (I understand that some capacitors need replacement)
2. Sometimes when I power up the rig I have no RX, only an audio hiss. Try to reset the rig with no luck; suddenly will start working fine. Software version is 2.062a and DSP 2.04b7. It happens 4 times in a month.
3. Cat control cable should be RS232 1:1 or null modem?
4. I guess S-meter is not calibrated, it shows around 10to 20 dB more compared to the one in the FT2K. Is there a way to calibrate it?
5. How can I key the rig via N1MM (there is a key on the back but no menu to configure like straight key)
6. No luck on finding how to use the memory keyer on manual (the worse user manual from what I seen until now).

Should I go for the Orion, or should I wait for a K3? I appreciate any inputs.

Best regards!

Adi, Yo2liw

Hi Gary,

For all around general purpose SSB the Heil GM-5 in the narrow position is hard to beat. One advantage to keep in mind is that it not only sounds good, it has a PTT button which a lot of the professional mics do not. This relegates you to a foot switch or VOX only operation. I also have a PR-30 which is ok but it costs a lot more and really requires an outboard EQ like the W2IHY 8-band which is what I use. I am still trying to figure out if I have it set up correctly for my deep voice. In fact, I would love to hear from others using this combo and what their settings are. I tried the Orion II's and the Omni VII's internal EQ but it apparently isn't enough to handle the professional studio microphones. And, then there is Ten-Tec's 709 which sounds good on my Omni VII. It does have more lows or so I'm told. Personally, I feel that we sometimes spend a lot of money on professional mic's and EQ's trying to get it to sound as good as the simpler mics like the GM-5 or an old D-104 on the vintage gear. Keep it simple!

Good Luck
Tony - W9JXN

PS: I called Heil regarding the PR-30 and PR-781 and they told me that except for the case the performance is about the same. I was hoping that I could use the 781 without any external EQ. Not so.

here is a link for you to see a simple mic that will fit in any radio and that I am using on my Orion II without any external EQ,just the builtin one and it sounds terrific either for ESSB or for regular dx audio,and best of all it cost just $50 shiped to your qth.

Adi,
I own an Orion II, but possibly I can answer a few of your questions:
2. Did you try a master reset and then re-loading the 2.062a firmware?
3. Cat control is RS232 cable, not a null modem. You can also use a USB to RS232 converter.
4. How do you know if the FT2K was calibrated? While it can be adjusted, its generally right on the money.
5. While I don't use the N1MM program, it still should work fine. Make sure your in the 1/8 inch stereo jack on the back of the rig, not the RCA jack (the RCA jack is for amplifier keying). Wiring like straight key with tip and and common used for keying. You'll still need some sort of external keyer, either by building one using examples in the N1MM reference guide, or K1EL Winkey (or similar). I use the K1EL USB Winkey to key my Orion II. By the way, you must put set the Internal Keyer to Off in the CW menu option or you'll get double characters and other weird issues.
6. Memory Keyer is easy to use. Hold down the Send 1, 2 or 3 button and you'll get a menu to record, play, or delete. Press Record and send a sequence with your key or program then press Stop. Exit the menu, and when ever you press that send key you'll get the characters you stored.

I don't know much about a K3, but I love my Orion.

Good luck,
Gary KO?Q

6632. This Discussion of Mikes -- It started out as something else

Yahoo group: orion565 (2009 — 2013)
Date: 2011-01-21 03:08:49 UTC
From: Bob McGraw - K4TAX
Topic: 6632 Message: 6632

This issue of mikes and radios and EQ's is a source of issue with me. There's a lot of unspoken information on the topic. Me for one, I do not believe that a EQ can fix anything. No offence to W2IHY and his system, it is a good product and has its application. But simply stated, bad audio going in will make for bad audio coming out. You choose the definition of "bad". Expensive mikes may actually overload the input stage before any level adjustment and thus they may sound bad for an unknown reason. This can be the 30 to 50 Hz breath pops that aren't heard or transmitted but still overload the input stage and such and takes a few milliseconds to recover. I've a couple of Neumann mikes that typically sell for $1500 to $3000 and they sound bad on any of the ham radios. So, more expensive mikes is not a valid key.

Now, lets look at the transmission path. Typically the male voice contains fundamental information in the 150 Hz to about 3KHz region and that is all that is needed. Nothing much past those numbers will get through the SSB generator and SSB filter in most radios. For those running ESSB, well the top end opens up but again a mike with an extended frequency response actually puts energy into the system that must be dealt with, otherwise attenuated, lopped off or filtered. Some radios place the carrier on the filter slope such that the low end is more abundant but at the sacrifice of the upper end. In any case it consumes bandwidth or energy of the system which takes away for the necessary total energy. In basic terms "lets not try to cram an elephant up a monkey's butt". Neither one will like it and the result is usually pretty nasty.

Now why do some $20 mikes sound good? Most likely, they do roll off on the low end below the typical useable range and thus they accentuate the warmth of the male voice. Some have a rising response up to the midrange of 3 KHz or so. Again, these sound nice for most SSB systems and ESSB systems.

And finally, the load on the source is another caveat. Ahh but this alone is one area that most do not realize how it affects the actual mike and the response of the mike. Just because a mike is advertised to be 20 Hz to 20KHz does not mean that it will perform uniformly under all load conditions. I've measured mikes in the lab that claimed 20 Hz to 20 KHz, while that may have been true the deviation from norm was +/- 20 dB. This is quite different than a mike that is 20 H to 20 KHz with a norm deviation of +/- 3 dB. Now to make things more complex, most radios will have a stated input impedance for the mike input. This says nothing about the impedance vs. frequency. It usually is the Z at one specific frequency and the value of Z can vary quite widely as frequency changes. Thus the mike is seeing a varying load with regard to frequency. Most mikes really don't like this condition. On the other hand, lower impedance mikes and I mean those with a lower source impedance not referring to load impedance specs and there is a big difference, will typical have less effect on varying load Z values. Then there is the dampening factor of how the diaphragm of the mike is electrically damped by the load. This again is more likely related to the characteristic of the load under varying frequency conditions. Over damping causes dull sounding paths while under damping typically causes loose or muffled bottom end and over accentuated high end.

Oh, I've not gotten into the room acoustics where the mike is used and I've not touched on mike technique. Both of those are subject for another chapter in the book. As a general rule, if your mike is operated ever more than 2" from your mouth, you need to consider a different mike technique. At the same time, too close causes excessive lip, tongue, nose and throat noises not to mention the rattle of the false teeth. Oh, how revolting! And no one likes to hear your amplifier fan or the TV in the adjacent room or the kids and wife screaming at each other. And if that mike is not working well for you at that distance, then you need to consider a different mike regardless of its price, brand or model.

73

Bob, I understand every point that you have made and, scientifically I agree with your statements... however bottom line is "how do you sound on the air" !

I use a Heil GoldLine Mic set in the Wide position into my W2IHY 8Band EQ and EQplus, then straight into my Orion II. I get nothing short of excellent audio reports. Of course there are other settings to deal with on the Orion II however those settings will vary from operator to operator, as will the settings on the W2IHY equipment.

You can talk paths, my 50 Hz breath pops, impedance, load, etc., but what it boils down to someone stumbling upon my station and saying "Wow, what a nice sounding station". Please do not compliment me! Bob Heil, Julius Jones and the engineering staff at TenTec did most of the work, I'm just the warm male voice behind the mic.

73,
Sam
K3SAM

(of course when looking for a microphone for your station, the operator will want to verify that the impedance is correct. If there is hum or distortion present in your audio (bad) before adding any sort of audio processing equipment then it will be there after the equipment installation. Bad in = Bad out. Da!
)

Just because a mike is advertised to be 20 Hz to 20KHz does not mean that it will perform uniformly under all load conditions. I've measured mikes in the lab that claimed 20 Hz to 20 KHz, while that may have been true the deviation from norm was +/- 20 dB. This is quite different than a mike that is 20 H to 20 KHz with a norm deviation of +/- 3 dB. Now to make things more complex, most radios will have a stated input impedance for the mike input. This says nothing about the impedance vs. frequency. It usually is the Z at one specific frequency and the value of Z can vary quite widely as frequency changes. Thus the mike is seeing a varying load with regard to frequency. Most mikes really don't like this condition. On the other hand, lower impedance mikes and I mean those with a lower source impedance not referring to load impedance specs and there is a big difference, will typical have less effect on varying load Z values. Then there is the dampening factor of how the diaphragm of the mike is electrically damped by the load. This again is more likely related to the characteristic of the load under varying frequency conditions. Over damping causes dull sounding paths while under damping typically causes loose or muffled bottom end and over accentuated high end.

Oh, I've not gotten into the room acoustics where the mike is used and I've not touched on mike technique. Both of those are subject for another chapter in the book. As a general rule, if your mike is operated ever more than 2" from your mouth, you need to consider a different mike technique. At the same time, too close causes excessive lip, tongue, nose and throat noises not to mention the rattle of the false teeth. Oh, how revolting! And no one likes to hear your amplifier fan or the TV in the adjacent room or the kids and wife screaming at each other. And if that mike is not working well for you at that distance, then you need to consider a different mike regardless of its price, brand or model.

Subject: Re: [orion565] Heil mic for orion 565

Hi Gary,

For all around general purpose SSB the Heil GM-5 in the narrow position is hard to beat. One advantage to keep in mind is that it not only sounds good, it has a PTT button which a lot of the professional mics do not. This relegates you to a foot switch or VOX only operation. I also have a PR-30 which is ok but it costs a lot more and really requires an outboard EQ like the W2IHY 8-band which is what I use. I am still trying to figure out if I have it set up correctly for my deep voice. In fact, I would love to hear from others using this combo and what their settings are. I tried the Orion II's and the Omni VII's internal EQ but it apparently isn't enough to handle the professional studio microphones. And, then there is Ten-Tec's 709 which sounds good on my Omni VII. It does have more lows or so I'm told. Personally, I feel that we sometimes spend a lot of money on professional mic's and EQ's trying to get it to sound as good as the simpler mics like the GM-5 or an old D-104 on the vintage gear. Keep it simple!

Good Luck
Tony - W9JXN

PS: I called Heil regarding the PR-30 and PR-781 and they told me that except for the case the performance is about the same. I was hoping that I could use the 781 without any external EQ. Not so.

6634. Microphones and settings with the Orion and Orion II

Yahoo group: orion565 (2009 — 2013)
Date: 2011-01-22 19:05:47 UTC
From: Larry
Topic: 6634 Message: 6634

I've had a number of emails and questions regarding my earlier post regarding the subject matter and the Orion or Orion II. I read carefully the post by Bob K4TAX and he has some good points but there are a couple of points that we could probably sit down over a good cold beer and talk about.

You MUST start with a good consistent microphone. There is no other way. The first question would be, how do you intend to use it. A good contest or DX microphone would make a ragchewers ears bleed! I am a ragchewer so please take that into account when you read my post.

One of the most popular ham microphones ever is the old Astatic D-104. It doesn't have a lot of low end and it has a presence rise, meaning that voice sounds in the range of 2 to 5 khz are somewhat emphasized. That's an excellent characteristic for a microphone to have for hams and when I spoke of the Behringer XM-8500 or the Shure SM-58, that's also what you get. However, because those microphones are dynamic microphones, they have a substantial low end. The key is that the output from these mics is clean and clear.

EQ is the magic that can make microphones sound like others that they are not. One of the old statements that I have heard a hundred times is that the guy has a fortune in audio gear to make his RE-20 sound like a D-104. Understand the the RE-20 is a very very flat microphone. There is no presence rise and the sound is not real exciting, like corn without salt, so to speak. So to make it more better (I love that phrase) you add EQ and give it a very precise presence rise. Now it sounds like a D-104 but the microphone cost $400 and the gear to correct it's flatness cost a lot more. Has it fixed anything .. well sure it has but hey, get a D-104 in the first place and save a bundle!

When I suggested the SM-58 or the XM-8500, I can give you three good reasons for doing so.

1) They are very consistent at what they do. I have four of them and they all sound exactly alike.

2) They are both price performers! At $100 the SM-58 is a solid, well proven microphone used in every application from communications and PA work to stage work. The XM-8500 is a real price performer (and obvious clone) at $20 and the two mics are so close in construction and performance that I don't know how Behringer can do it!

3) The Orion and many of TenTec's radios have a simple and effective tone control mechanism. It is simple and you cannot do what an expensive EQ can with it but if you have chosen the right microphone, you won't need anything else. The SM-58/XM-8500 with it's presence rise

has too much low end for ham use. The Orion TX EQ can be set to "0" which is essentially flat. The SM-58/XM-8500 would sound way too bassy. It can be set to -20 eliminating all low end or to +20 to eliminate all high end. By using an SM-58/XM-8500 and setting the EQ to around -8 to -12, you are taking away the low end and much of the proximity effect that these mics exhibit.

Did I try the Heils ... yes and have I tried the IHY box ... yes, and with mixed and unpredictable results. Are they bad ... no ... but my personal opinion is that anybody that uses them is either very lucky or very talented and has spent more (time and money) than they had to.

I have a sound file that was recorded in Chicago by Dave W9AD of my Orion and an XM-8500 on December 15th of 2010 at 7 AM on 80 meters. That's about a 350 mile path. I uploaded the file to my server so if you would like to take a listen: http://w8er.com/w8er.mp3 will get you there. This sound file let's you hear the results of what I have done and because of the consistency of the microphones, your results should be similar.

Sorry for the long post guys, but this is a deep topic and I hope that this helped. -- Larry W8ER

Well said,to probe that you don't need to spend much to have a good TX audio,go to the Files in this group and enter the AD4C folder and download the latest MP3 I posted this morning where I have recorded the TX audio from my Orion II heard at my K3 and recorded on my Dell laptop,its named "AD4C testing the O2....".
I explain in it which mic is,where to buy it and all the radio settings,there is nothing in between,just that mic straight to the radio.This is a not expensive solution to have a good audio.

From: James
Topic: 6636 Message: 6636

Friends,

I posted my saga over on the Tentec reflector the last couple of days but thought I would go ahead and post it here too because I'm still having issues.

I'll try to make this brief. When I first turned it on Friday, the S-meter was frozen and neither receiver would work. I have basically worked on it all weekend and have traced it down to some kind of issue with the front panel assembly and cards A7/A8. In general, I found I could induce the lockup by tapping on those boards or even tapping on the front panel plastic over on the left side.

I suspected some issue with the board-to-board connectors like has been suspected with the RIT problem. I carefully took the A7 board off and cleaned every pin with an eraser and then applied a coat of Deoxit D100 (needle applicator) and reassembled everything. It still doesn't want to work right. (I have done countless Master Resets, RAM Resets, and software reloads along the way).

At this point, when I turn it on, I get no audio, the main receiver is dead, the S-meter is frozen, and the subreceiver audio is only present on the headphone jack. If I loosen the screws on the A7 board and apply some pressure at a specific point, everything comes to life. I'm not sure at this point if the pressure is just moving those board-to-board connectors around or if I might have a cold solder joint that I'm flexing. I've had this Orion a little over 4 years and have never even had the front panel off before this weekend. I pretty carefully cleaned all those board-to-board pins and with the Deoxit, I was pretty hopeful that was going to cure things. It did cure my RIT which works fine now. It's basically never worked since I got the Orion.

Anyway, I thought I would post this over here in case somebody has experienced something similar.

Dave...try this, I have the same type issue. When I turn the rig on, no audio and if I hit the tune button, no matter what band or antenna I get "high swr". I would do a mater reset and it would work.

What I have narrowed it down to is in the TUNE circuit. When I turn it on and there's no audio, I cycle through the TUNE/AUTO-TUNE menu. Apparently there's a 3rd selection in there and when I power up, it's in that 3rd selection and from there I cycle through the TUNE selections and it's all good. REC and TRANS

At least that's the issue on my O1.. good luck

Well now,
Let me say that I am the first one to be skeptical about "fix's" I read about on the internet. I've been fooled more than one time...
In this instance the timing of this subject on this group could not have been any more perfect. I was at the point of frustration with my Orion II TX audio that I was beginning to think about different radio's. I too had been through a number of different microphones and settings. I have really worked hard to understand the theory involved, within the scope of my amateur status anyway. I worked on technique, anything I could do to help my really muddy audio. Perhaps it is just my voice but I was not able to come up with an even passable solution for my audio and I just did not want to go the external EQ route.Finally I sent Larry an e-mail and asked him a couple of questions about his set up. Glad I did! I went out Saturday to a local Guitar store and purchased a Shure SM 58 that the clerk said I could return in the next 14 days if I didn't like anything about it. No reason not to give it a shot I thought to my self. All I can say is wow, I finally have nice clean audio. In the end my settings are remarkably similar to Larry's, and I have to guess that this mic is just a nice match for the Orion II and my voice. For the first time my TX audio is what I have been looking for. The other thing I learned is that the guitar shop is a good place to talk about audio. Great enthusiasm for my issues, good prices and an open invitation to try different mics if this one didn't work out.

Topic: 6634 Message: 6640

I have a persistent problem with the RIT on my 565AT. It stopped now to work, the knob is dead. I know about the solution by K4ZNO using the conductive silver grease but AFAIK a contact treated in such way will became 'welded' within few weeks and if you disassemble the sandwiched boards you have to repeat the treatment again, including VERY careful clean up before applying the grease...

It seems more reasonable to replace the junk tin plated pins/connectors with better quality, gold plate type (why our 'SSB Company' used such gimmick?). The problem is the lead-free solder with higher melting temperature, a conventional micro-tip soldering station seems to be rather inefficient here. Do you have some tips how to do the replacement in most safe way?

From: w1nt
Topic: 6642 Message: 6642

Did 566 firmware 2.044a remove the ability to toggle between RF and AF AGC? Looks like the menu toggle in the OTHER menu is gone unless I am missing something.

If it's been removed does anyone know why?

Thanks,

Brad

It was removed, as it had issues along with some other "improvements".

According to John Henry, they went back to pretty much basics, and will build from there rather than try and throw out a bunch of features all at once.

Andrew,

This is very interesting! Way back in the early days of the Orions, but after (I think) John Henry left Ten-Tec, I was seriously considering the Orion I. A couple of my astute friends cautioned me against it, due to the software problems, so I deferred. Later, when the Orion II came out, I did go ahead and buy one, thinking that by then they must have solved some of the initial problems regarding software. I was wrong! I got so confused as to which "updated" version of the software worked, and which didn't, I didn't do much upgrading. The Orion II worked O.K., but not nearly to its potential in my view.

My friend's cautionary statements centered around their understanding that a big part of Ten-Tec's problems regarding software was that each patch they came up with only masked the perceived problem, and tended to create other problems in the process. Now, this wasn't at all certain, but just their suspicion. However, I distinctly remember them saying that they thought a lot of the problems would go away if Ten-Tec would rebuild the software rather than patch it. I may be wrong, but I think this is what John Henry wanted to do initially, but Ten-Tec wouldn't agree, and that may have contributed to his initial departure--a difference in opinion as to how to really do it right! Now it seems that is exactly what they are doing, and if so, I applaud them for finally doing so.

In any event, and whatever the circumstances really are/were, it certainly seems like John Henry is making good progress, and Ten-Tec is allowing him to make unfettered decisions to get things heading in the right direction. I think all Orion owners should be greatly encouraged as to how things seem to be heading. It certainly seems to me that there have been a lot of positive developments lately, and I think there are a lot more smiling faces out there.

Larry and Jim,

This sounds like a master reset upon power up.
If this is the case, Jim should look at:

Dave.

You pretty much said it. They kept putting more perfume on the stink, and it just made it worse.

When John came back, they seem to have scrapped that approach, and built a good basic package that took care of most of the problems.

I got the impression that there will be more additions to come that will be nice to have. They even should work!(HI).

6651. Band stacking registers

Yahoo group: orion565 (2009 — 2013)
Date: 2011-02-04 15:46:33 UTC
From: Larry M
Topic: 6651 Message: 6651

Is it me, or is there a problem with how the bandstacking registers on the Orion II, v2.044a are working?

Every time I move between bands and between registers on each band, I seem to have problems with the modes. I'll leave a particular band/mode combination in a register, but when I come back to it, after having been on another band, and the combo from before is wrong.

Is it because I'm letting DX4Win change modes as I click on spots? Or is there something wrong with my firmware install?

Anyone else having this scrambled band/mode problem...or have I not been watching the reflector assiduously enough?

Thanks.

Larry, W0PR
Northfield, MN

Barry,

Could you expound on proper operation and setup for various operation types? ie SSB Contest, SSB dx, Casual operation, PSK/ or digital modes, cw contest, cw dx, cw casual etc.

Please reference the firmware you are using.

Do you find the ez reference guides for Orion to be valid or helpful. Also TX setup, do you have a starting point for various operating modes?

I'm looking forward to learning the capabilities of the Orion. Thanks for your and anyone else's constructive input.

6653. Re: [orion565] Re: New to Me Orion One

Yahoo group: orion565 (2009 — 2013)
Date: 2011-02-04 17:03:33 UTC
From: Barry N1EU
Topic: 6522 Message: 6653

My gain setup is the same for all operation types. Here's something I wrote
on the subject - feel free to improvise and come up with your own version:

The Elecraft K3 and Ten-Tec Orion, with their hybrid analog/digital
RF-IF chain, offer significantly more receiver gain than operators are
used to. Simplistically
setting RF Gain to maximum, which worked with radios of yore, will
yield unsatisfactorily noisy results in almost EVERY case. Some
degree of RF Gain
"throttling" must be engaged by the user and is *crucial* to the
proper operation of the K3 and Orion receivers and enjoyable
listening.

1. If at all possible, use headphones for listening. The more
isolation the headphones provide, the better. The Sennheiser HD-280
and Direct Sound EX-29
headphones are considered by many to be highly isolating but I
consider them barely adequate.
2. Determine the appropriate AF Gain (AFG) setting - once
determined, this is the AFG setting you will normally use all the
time:
- turn ATT off, PRE on, and RF Gain (RFG) maximum
- tune in a very strong (s9+) signal
- adjust AFG to a moderately loud but comfortable level
*(first set AF Gain Hi/Lo in the config menu - I recommend the LO
setting for headphones)*
- note the position of the AFG control - this is your AFG
setting - *leave it at this level, all the time*

3. With ATT off, PRE on, and RFG max - tune to an empty part of the
band so you're just listening to band noise with the antenna connected
4. Assuming you have an antenna switch inline with your feedline,
switch the antenna in and out - if you clearly hear an increase in
band noise as you connect
the antenna, repeat the test as you decrease gain in this order:
- turn PRE off
- turn ATT on
- decrease RF Gain control

You want the least amount of gain that still allows you to hear an
increase in band noise when the antenna is switched in.

Topic: 6624 Message: 6657

I've found that the correct mike, what ever model or brand it may be, fed direct to the mike input will usually exceed the performance and produce better results of most outboard processing systems. I've also found that the price of the mike has little to do with its guaranteed performance. I believe that Larry's findings support this as well.

Now If I could just figure a clean way to add an internal PTT switch to the mike. First this requires changing the 3 pin XLR connector insert to a 4 or 5 pin connector.

From: Jeff Walker
Topic: 5231 Message: 6660

Orion 1 with all V2 updates done by Ten Tec and has the latest
firmware 2.063XG beta installed. It has the INRAD #762 filter installed in the 1khz
position (see
http://users.vnet.net/btippett/inrad_.htm) for full info. I have the factory manual and
shipping box. I'm the
second owner and it's never been around smoke. $1875.00
shipped to lower 48 U.S. $80.00 for the matching 307B speaker and $110.00 for the 302R
remote encoder/keypad. Speaker and tuning pod available with the O1 or alone after the sale
of the O1. E-mail off list for pics or questions.

6661. Aux i/o audio output failing on 566 V2.044A

Yahoo group: orion565 (2009 — 2013)
Date: 2011-02-09 03:15:08 UTC
From: Bruce
Topic: 6661 Message: 6661

Hi,
Just as I am out of warranty, my favorite radio has developed a problem. In the past couple of days I noticed the line output from the Aux I/O is beginning to fail. I have tried my second unused cable and nothing changes. When I plug the connector into the Line out jack on the rear panel everything is fine. Anyone seen this before? I'll call Ten Tec in the morning to see what they have to say but I thought I'd ask here first. I've obviously re-set the radio as a first try with no results. I'm not aware of anything in the menu that would have impact and besides it works and then disappears. Nothing amiss visually within the radio and everything else works fine.

6663. Update on 565 firmware

Yahoo group: orion565 (2009 — 2013)
Date: 2011-02-10 19:59:32 UTC
From: saukp
Topic: 6663 Message: 6663

.... F Y I ......

this info was posted on 9feb2010
http://lists.contesting.com/mailman/listinfo/tentec

The Orion 565 firmware is in test phase. When it is deemed
sufficiently stable and mature, it will be released to the general
public. So far, this specific version looks promising, but I want to
give it another week or so before I would even chance risking sending
it out to the general public.

High Speed Sweep - We are in the development phase, and cannot
identify a beta date yet, nor a release date. Need to make sure it
works properly as promised.

Hope to see several of you at the Orlando Hamcation this coming weekend.

I'm mixing business with pleasure this week, vacation with my wife in
FL most of the week, then onto the convention this weekend, then back
home.

Take care,
John Henry

Subject: [TenTec] When loading Orion 565 V2.064x11

When updating to V2.064x11, it is recommended that after you upgrade the firmware, that you turn the rig off, and perform a RAM Clear reset followed by a master reset and clear user memories and filter settings.

RAM clear is as follows:
1. Orion off, power supply on.
2. Press and hold the LCK button just below the VFO B knob.
3.Turn on Orion and continue to hold the LCK button until Master Reset is displayed on the screen. BATTERY FAILURE may also be displayed, disregard.
4. Release the LCK button and allow the Orion to boot to 14.250.
5. Turn the Orion Off and perform the Master Reset using The MAIN RX/TX button. User memories and filter settings MUST be cleared.

THEN perform a Master Reset.

hi john

yep...looks like a master reset is required to be done twice

i have loaded the update on my orion per JH instructions...

after the first master reset..you may only hear clicks and buzzes on the receiver

after the second master reset, everything came to life

i did notice one bug
when in cw mode and vox is turned ON...the rig goes switches to xmit with no power output.
turn vox off and things are back to normal

this came up when i was doing some ssb contacts, then went to try some cw and i did not turn the vox off

Topic: 6672 Message: 6674

Hi John,

Normally, the answer is no, you don't need that second master reset.
However, since sometimes people go from much earlier versions of firmware, e.g. pre 1.375, with a much different memory map, and with some very different settings, sometimes it is beneficial to do a second Master Reset manually. Not always.
So, just for consistency sake, I have added that to the steps just for now when going to 2.064x11.

Also, some have found that after the first master reset, sometimes they get no audio when transitioning to this version. A power reset then resolves this issue. There are multiple DSP processors running, and sometimes the transition in memory maps can confuse them. But once they are up and running properly, I'm sure people will enjoy the enhancements.

Hi,

Ref 2.064X11

I think I might have a 'no biggie'.

Band set register A has a 0Hz PBT offset, Band set register B has a 300Hz PBT offset

When set to BSR A and adjusting BW all is normal. Then change to BSR B and PBT ofset shows 0 but audibly, and in reality I think, is still set to 300. A tiny touch of the PBT control causes the PBT display to come good. Happens with other mode/band/BSR/BW/PBT combinations too.

Further, whenever the BW is changed the PBT value displayed remains static across all BSR selections, even when changing the BW of the sub receiver.

Does not happen if the BW/PBT control is left in PBT.

PBT display can be restored by either selecting PBT and turning the control slightly or turning the low-cut/high-cut.

Looks like the display is not updating correctly.

Anyone else seeing this?

Regards

Martin, HS0ZED

Topic: 6667 Message: 6683

I'm having a problem getting the update loaded.

I have the Orion and PC connected correctly. I downloaded the update from the Ten Tec web site. I used Firefox for the browser. I turned the rig on. After the rig booted I clicked the download to run. I followed through the steps to the Ten Tec Flash 32 utility. Puled down the Process menue and clicked on Up Date Radio.

In the lower left corner I saw the number counting up. All was going well until the numbers reached about 1380. The progression slowed nearly to a stop. I waited a couple hours. When I checked back the number was up to about 5000. So, I waited it out until the numbers reached 9999.

I did the Master Reset using the LCK under VFO B, turned off and did a Master Reset using Main RX/TX, turned off and restarted rig using the LCK under VFO B button, turned off rig and rebooted.

I checked the software info by holding the Menu Button for 2 seconds. The info reflected no change from the old version.

I have since started over the process. The numbers in the lower left corner are now progressing very slowly and seem to be stalled around 1400.

Any advice please?

Please email a copy of your help to me off list, as I only see the list once per day.

Thanks all.

Ron, are you trying to install the new firmware release into an Orion II (566)? If so, that would explain the error message you're getting.

The new release is for the Orion 1 (565).

Hello,
First off I would check to see if the antenna tuner is offline. I would try it with and without the tuner in line
. With a 50 ohm load you wouldn't need it. The only thing different in the transmit path for the different bands is the low pass filters which should be switched in by relays and the antenna tuner.
In the low pass filter you have the relays caps and coils that could possibly fail. Since several bands are affected I would move one step back to the relay drivers for those bands.In my homebrew I use a uln2803 to drive my relays.. I don't have the orion 565 but you can check the manual / schematic. Do you have any test equipment?
a Vector network analyzer would be nice for testing the LPF function :)

Check your power cord fuse. The fuse holder has been known to oxidize which will limit the current to the unit (which equals a loss in power output). There will also be a voltage drop across the fuse if that is the case. It has happened to me with my Orion II and with my ICOM's (all of them).

It's worth checking either way.

If you use the subreceiver on cw, this upgrade is the first v2 firmware that doesn't suffer from significant dsp filter blowby.

Mike -

I really like it. It seems very stable.

I like that the serial command for the tuner is working in the new firmware.

I also like the improvement to the NR control. The NR is the main reason I prefer the Orion to my K3. On CW the Orion NR is eliminates background noise while maintaining the tone of the signal. The K3 NR works at it, but only reduces the background noise and adds a digital sound to the signal.

Finally, I have an antenna that has a problem on 30 meters. If I run too much power into that antenna, the old firmware would shut off the Orion, leaving it dead and needing the OFF/ON sequence to bring it back to life. With the new firmware, the Orion also shuts down, but it reboots itself without any interaction from me. That's cool, especially when operating remote without the ability to throw the switch at the home station.

That's my experience after using the new firmware a couple of days.

I too have been waiting for the comments to flow..hi I guess I'll have to jump in and be one of the first. I know there were many improvements listed in the update. I guess the one that I noticed the most was the DSP noise reduction. I can hear a big improvement especially in the SSB mode that I have always felt was lacking performence. In cw mode I don't notice that big a difference probley because of the narrow filters used. I call the upgrade a winner and long over due.

Here is my brief opinion based only on some light duty use over the last few days. I had previously been using 1.373b5 having gone back to that from later v2 versions for a couple of reasons in particular I thought it sounded better and I found the NR behaviour better than the later versions.

Display: Seems to be much brighter. At the default start up 50% setting it looks washed out. Need to reduce it to 35% where it now seems brighter and crisper than earlier versions. Believe I can account for this with the hardware contrast adjustment. I still think it looks a little rough, some vfo A numbers have some serious jagged edges and the alignment of the soft key legends is still annoyingly all over the place.

DSP NR: This definitely works better than earlier v2 versions but I have not spent enough time comparing it to the earlier 1.373b5 version that worked well for me. I can't comment on the sub receiver blow by issue as I never experienced that.

DSP NB: I have a line noise problem at times and whilst setting the DSP NB at 9 will almost completely remove this, anything less, does absolutely nothing to it nor any other pulse noise that I can generate.

AGC: All the settings are as before and it all seems to work as before. I still cannot quite get why the threshold setting cannot be made more flexible, displayed in dbm or made more logarithmic in action I find it overly fine in resolution.

SWEEP: Seems to have received a lot of attention and looks quite a bit better, also performs quite well. If this is what you want then I would say this version has the best sweep so far. Have a problem with mine with strange artefacts once in a while, see the video at http://www.youtube.com/watch?v=-JuHwp0c6Lk

KEYING: I have not seen the effect others noted about the interaction between VOX ON and switching to CW that would cause the rig to key.

There seems to be an engineering type menu either by design or mistake. Press menu then rx then the 15 meter band key. You will get a menu of what look like S meter calibration values. Using the vfo knob as a cursor and the multi knob to change the value it would appear that you can change the digital number for each S meter value. Looks like you cannot change the S0 setting and that changes need to be locked in with the vfo A enter key.

SOUND: With appropriate bandwidth, pbt, and AGC settings the radio does sound quite nice. I have always been aware of a dsp sound to any such radio when compared to an analogue radio. This is the first time I have heard an

improvement in this direction and without any processing to combat interference and such it really does sound almost like an analogue radio to me.

I note a couple of other things that may have been in earlier versions but I have not really checked. PBT and BW settings or displayed values can have some less than predictable action at times depending on knob function selection. Tracking BW does not synchronise the values if the main and sub are on different modes when using high cut to vary the value.

It is a shame that there are no extra screen enhancements, half screen sweep option is one that comes to mind, or a screen and upgrade for perhaps a multi band graphic eq. It's all software and I can only presume that is the problem in the Orion's case, the cpu horsepower is just not there and this is about as good as it is likely to get.

Well, now I don't see an Eagle in my future.

The new firmware has brought a really good rig up to a really really superior rig in my humble opinion.

I operate a lot of remote true hand key CW over the internet with the Orion. With the previous firmware the NR was useless. Now I have no more "fiddling around" with controls to copy through the noise.

Other than the glitch with the VOX/CW issue, everything else works great.

Great job John!

Thank you and the folks at Ten Tec.

6699. ORION 565 UPDATE 2,064X11

Yahoo group: orion565 (2009 — 2013)
Date: 2011-02-24 03:19:50 UTC
From: petert208
Topic: 6699 Message: 6699

SO FAR THE NEW V2 UPDATE IS WORKING OK. (WAS USING LATEST V2.) NICE TOUCH TO THE NEW SWEEP. RECEIVER SEEMS TO BE MORE QUIT LESS DSP SOUND. FOUND IN THE FILTER MENU WHEN YOU GO TO 20K SOUNDS LIKE THE RECEIVE IS AT ABOUT 1K. MOST OPERATORS WILL NEVER LISTEN AT 20K BUT THERE IS A BUG AT 20K SELECTION. THE FREQUENCY DISPLAY DOES SEEM TO HAVE SOME DISTORTION ON THE EDGES WHICH YOU WILL NOTICE MORE ON THE LARGE VFO A FREQUENCY DISPLAY.

AFTER TWO DAYS OF USING THE NEW V2 UPDATE IT'S NOT BAD. I LIKE IT BETTER THEN THE BETA V2 UPDATE SO FAR. STILL NEEDS MORE TIME FOR EVALUATION. I DON'T OPERATE CW SO I CAN'T COMMENT ON THAT MODE OF OPERATION.

I WILL SAY ONE THING I HAVE OWN TWO ORION II'S WHICH ARE GREAT RIGS, BUT I LIKE THE ORION I BETTER. IT COULD BE THE FILTERS OF THE ORION I VS THE ORION II FILTERS. THAT'S JUST MY OPINION AND LOVE TEN-TEC RIGS.
I THINK ANYBODY WOULD SAY THE ORION I OR II IS GREAT LOOKING RIG AND A FUN RIG TO OPERATE. WHAT OTHER COMPANY GIVES YOU TWO VFO KNOBS AT THE SAME SIZE AS THE MAIN VFO AND A LARGE SIZE FREQUENCY DISPLAY. ETC. ETC. ETC. JUST A GREAT RIG FROM TEN-TEC USA.

Hi Folks,

My Orion II has developed a new problem. If the rig is on a short while, and you change the VFO, the receiver goes quiet and it won't transmit. Turning it off and back on will make it work till you change the VFO dial again and the RX goes bye-bye and it won't transmit again. I tried a master reset just in case.....but no luck.

Anyone else ever get this problem?

Thanks,
Bill/K1FPV

Sounds like a dirty/oxidized connector. Re-seat the connectors for the rotary encoders. Unplug each cable and then carefully plug it back in. Do take care to see that the pins are aligned correctly when doing so.

OK.....thanks Bob! I'll give it a try. The funny thing is that it occurs only after the rig is on a while and warm....not when it is cold when I first turn it on....but again it is possible the slight change with metal expansion with temperature increase may be contributing to the problem.

Hi Paul,
I had a problem like yours on 2007 and I solved it by sending the Orion
to a UK TenTen lab in England. They had to replace the DRAM.
I've just loaded the latest firmware and my first impression is that
it's working fine.

6706. Re: Orion 565 Firmware Released

Yahoo group: orion565 (2009 — 2013)
Date: 2011-02-26 12:58:02 UTC
From: John K Gotwals
Topic: 6667 Message: 6706

I too had a similar problem on my 5654 in about 2006. My slow firmware update problem was fixed when I configured my serial port prior to running the update program. I was instructed to use the following settings:
speed – 57600 baud
parity – none
data bits – 8
stop bits – 1
I used these settings earlier this week when I updated to 2.064X11, and the loading time was roughly 5 minutes.

6707. Com port problem on 566

Yahoo group: orion565 (2009 — 2013)
Date: 2011-02-27 01:55:42 UTC
From: o1_orion
Topic: 6707 Message: 6707

The com port on my Orion II no longer works. I cannot upgrade firmware and the radio control no longer works. There is no response testing the port. I suspect the 232 chip and or the related caps. Has anyone had this problem? What are my options? Does anyone have a proceedure for testing and replacement of the chip and caps?
Thanks
NA1P Louie

6708. RE: [orion565] Com port problem on 566

From: Martin Sole
Topic: 6707 Message: 6708

I had this problem on a 565 Orion. The circuit looks identical. It has been reported by others in the past as well. Whilst mine had a new MAX232 chip and capacitors I believe it was the capacitors that were the real problem. Four 1uF surface mount capacitors fitted to the underside of the DSP board. A straightforward change if you have the tools.

From: o1_orion
Topic: 6709 Message: 6709

My friend has my old Orion I. He does not have the internal tuner and he uses the tune button to tune with a outboard tuner. Every once in a while the radio will stick in tune mode. The only way to fix it is to do a full reset. Has anyone had this problem or have any ideas whet the problem might be.

Thanks
Louie NA1P

From: James Skalski
Topic: 6709 Message: 6710

Do you have more information? What firmware? What tuner? Perhaps he can contact the tuner manufacturer and ask for help. It may be a problem with the control circuitry in the tuner. It may be more than the tune circuitry in the orion can handle and require an interface. It may be rf getting into the control wiring. In that case a toroid might be helpful. If the tuner is an ldg they should be able to help as they supplied the ten tec tuner.

Hey Bob,

Finally got around to taking the rig apart. It has been tough picking up anything that is a little heavy with a broken rib. Cleaned the connectors with blue shower and put it all back together again and it is working fine. Thanks for the input.

Bill:

Glad you got the problem solved. I perceived, based on your excellent description, it was a thermal related connector problem. his is not unusual at all and is certainly not unique to Tentec products.

When I was with Sony Professional Audio, I dispatched service engineers all over the world to replace some 500 IC sockets in a model of a multitrack recorder. It was about an 8 to 10 hour process. The initial condition appeared the machine worked fine for a couple of hours after power applied. After that, intermittents began to appear. Once we eliminated the connectors the reliability vastly improved. The negative side was this made service ability a bit difficult. There's always some trade-off's.

Paul,

I just bought an Orion I and am waiting for it to arrive. I noted your comment about operting hand key over the internet and am interested in doing the same but was not aware that the Orion had that capability. Could you give me some details on your setup? I would gretly appreciate it. IF there are pictures or other documentation you can send it to my email ncrary at excite dot com.

Hi Bob,

Well, that certainly brings some memories of the occasional nightmares I had working on several of the Sony Tape decks we used in broadcasting. We obviously gave those units more wear and tear than I do with my Orion. Besides, those Sony tape decks were in service 20/7 and never subjected to temperature change in continuous use in the racks we had them mounted in. Much of our maintenance was due to operator abuse and occasionally cleaning.

Bill:

We had a model of analog 24 channel multitrack that somewhere along the line the "bean counters" decided that too much money was being spent on parts. They did a "cost down" and directed purchasing to find a less expensive IC socket. They did. About 6 mos after these were implemented into the machines the complaints started. Snap, crackle, hiss and pop and loss of audio. This was traced to the connection between the contact in the socket and the leg of the IC's. We found that by using a much better quality socket the issues were no more. To send a Service Engineer to the field, travel, lodging, meals, time and parts, to change the sockets costs an average of $1500 per machine.

When I questioned the decision to change to the cheap sockets the answer came back "that's the only socket we could buy for under a nickel". The ones we put in cost some 25 cents each in lots of 10,000. No one could actually figure the damage and loss of reputation that took place. I figured the direct cost for that program was some $250,000 direct to the bottom line.

In actuality and from experience, leaving a product turned on 24/7 minimizes the heating and cooling thus the circuits are more stable both electrically and mechanically. The way we use ham equipment is much harder on a product largely due to thermal change and oxidation of pressure contacts for sockets and plugs.

Were those tape decks APR-5000 series machines? Or were they the JH-110 series of machines? Sony purchased MCI in 1981 and continued with the MCI label with JH products for about 2 years while migrating the Sony technology and methodology into the product line. Then they dropped the MCI logo/badge and continued until 1995 with the Sony products. Today, the professional audio group is virtually non existent.

I want to connect my New Orion II to my computer using the optional 712 usb adapter I purchased from Ten tec so I can use HRD. I also have an optional foot switch and it looks like these accessories both need to connect to the same connection in the back.
Any help would be appreciated.

Bob,

We had several different models. They were old and some parts were tough to get from Sony. I don't remember the actual model numbers. I worked mostly on the RF side of the house getting us up and running for DT operation. They were on VHF channel 13. I helped set up the UHF DT setup and began the work on the channel 13 side too as when DT became mandated, they planned on going back to VHF channel 13 and had already obtained FCC OK to do so.

When I retired in 2005 before the mandatory DT changeover date, Belo.....the station owner when I worked there and still owns the station, was thinking of getting all digital machines....no more tapes. These machines were older analog machines that were bought at different times long before I worked at that station. The station ownership had changed several times in years prior too.

Jose,
I am not sure I am answering your question. The 712 adapter allows various digital modes to be used with the Orion II. It does not control (frequency changes, volume, etc.) the radio via HRD or another program. You need either a serial connection from your computer to the serial port on the back of the Orion, or use the Ten Tec #316 (or any other serial to USB adapter) to control the radio. I don't use the footswitch with my 712 adapter so I can't help with that, but I would imagine you would need to make some sort of cable to connect the footswitch and 712 together. My understanding is the foot switch just enables the PTT.

6721. We have a problem with DSP 2.08b84, Orion I 565

Yahoo group: orion565 (2009 — 2013)
Date: 2011-03-04 15:33:40 UTC
From: hglent
Topic: 6721 Message: 6721

I have found what I think is a serious problem with the latest firmware. I hope some one can straighten me out.

I am loosing most of my settings after the rig has been turned off over night. When I power up none of the frequencies I had set into the 4 (A,B,C,D) registers are in the rig. This occurs on all bands. The 4 frequency registers on each band revert back to the default frequencies.

When I power up in the morning, I find the mode ie LCW,USB, etc also returns to the default, and the CW Speed has returned to OFF, and when pushed indicates the default 20 WPM.

The 3 internal CW memories are not lost nor any of the other settings in the menu items.

I have tried disconnecting the RS232 cable and the auxiliary audio cable when shutting down for the night, thinking the problem may have something to do with the PC and HRD. I'm running HRD V5.2837. The PC is turned off before I turn the rig off in the evening. All equipment is power off over night.

What am I missing here? Is anyone else having a similar problem?

Thanks

Paul K.

Hi Paul,

Do a quick experiment some time.
Disconnect the PC controls to the rig.
Change your frequency, e.g. go up 5k or so.
Wait 20 seconds. (don't touch anything on the Orion front panel during this time)
Power off the Orion
Wait 5 seconds or so.
Power it back on.
What frequency is it now on? The modified? or the old?

Do the same for mode.
Change Mode from LCW to AM or something else.
Wait 20 seconds.
Power off the Orion
Wait 5 seconds or so.
Power it back on.
What mode is it now on? The modified? or the old?

Most TenTec rigs have a 15 second timer that gets bumped back to 15 seconds every time any thing is changed in the rig from the user. All front panel controls will reset the 15 second timer, all menu item adjustments will also reset the 15 second timer.

The same holds true for commands from PCs. They will reset the timer also.

My "shutdown" procedure when connected to the PC would be:
Turn off the PC program, and ALL devices that communicate to the rigs through the serial interfaces (some steppir motor controllers do, etc, so get'em all)
Wait 20 seconds.
Power off the Orion.

Let me know if this resolves your dilema. If not, I'll investigate it further here.

Thanks,
John Henry

Hi Paul, I'm experiencing the same symptoms with my Orion I and this latest firmware update. I've ordered a lithium battery from Tentec. I'll advise if this cures my situation. Thanks, David - ab8d.

John,
I tried the sequence. Every time the rig comes back on with the modified change. Just as it should.

I think this is occurring after being turned off for quite a while. Over night.

I use exactly the same shut down procedure you out lined. Maybe the battery? I didn't think of that one!

Sounds to me like the battery might be shot! I just had my Orion II apart to clean some connectors and checked the status of my battery just in case.

Mine doesn't look like a "standard" connector. Any molex connector I've seen was always white nylon, the band data cable supplied by Ten Tec is a medium brown in color and fastens different than the typical molex connector. The pins themselves look the same as a molex connector however I don't know the size. As an aside, I use it to connect my Orion II to my Hercules II amp.

They are not "Molex" connectors, but hey are industry standard.... just a different one.... "AMP" connectors.

I recently bought some from Digi-Key..... they are made by TYCO/AMP, with p/n 1-640523 and Digi-Key p/n #A14116-ND 'Conn Plug 15 POS MINI Rect'

They come 'naked'..... no pins, you have to order the pins separately. There is a minimum number per 'unit' of pins. Digi-Key #A14197-ND, Tyco/Amp p/n 641300-1 'Conn Socket 18-26AWG Tin Crimp'. I got a pack of 100, to have spares. The crimping is a bit tricky, you must be careful to get the crimp shaped correctly (round with a small diameter),because the pins get fitted deep into the body of the connector, and the regular 'molex' pin extractors I commonly find do not fit into the holes.... and the 'official' insertion/extraction tool costs $$$....

In the TYCO/AMP selection, you can get 'hooded' versions of the connector instead of just the 'open back' style.

I got connectors/pins to interface my 565 to either my ameritron ALS-600 or ALS-1300.

Hope this helps, 73

I have replaced the CR2032 battery, but not the lithium battery.

I will let the rig sit over night and see what happens.

Thanks for all the help.

FYI.....To the group

This is my short list of issues I have come across while recently operating in ARRL SSB DX contest this past weekend. These are three issues I came across while operating that caught my attention and were repeatable. I know that Repeatability helps find the root cause.

Also i know how hard the TT guys work to make a high quality product and the customer support that goes with those efforts.

My Orion is still a keeper

Paul K3SF

1. CW VOX -

Symptom Number 1 is when in cw mode and vox engaged the radio goes into a pseudo transmit mode...the antenna is switch from receive to transmit and amp relay is keyed...this requires that vox be disengage to clear..not operating split

Symptom Number 2 .. when operating split and not mode tracking rcv main in ssb mode and rcv sub is cw mode and is the xmit freq and vox engaged..when speaking into mike ..get a cw carrier and rig locks up in transmit mode..this requires a power down to clear

2. BPT and BW not display updating to actual when switching bands

Symptom Number 1.. when setting BW/BPT on current band all seems and operates as expected, what the radio report on the display is what is happening as verified via audio spectrum analysis...when changing bands the display values stay the same (does not change at all) but the actual PW/BPT values are what was set for the new band previously ...the display does finally update to current values only when there is just a slight adjustment of BW/BPT knobs.

3. Spectrum Display Scanning BLIP Bursts

Symptom Number 1.. when the spectrum display is engaged, there appears on a rather periodic basis two different spectrum display interrupts that appear a a series of medium height blips every couple khz across the spectrum display as a burst of blips...followed later by full height blips of the same characteristics...this would occur every couple of minutes... no change in receive signal was noticed

when antenna was disconnected..these symptoms still persisted..
and
external signal source was eliminated as the cause when i used an sdr-iq to see what was out there that might do this..nothing found

I have also experienced issue #1.

I have never experienced the problem in your issue #2 and cannot duplicate it on my 565. Maybe a Master Reset with a memory clear might help.

Issue 3; I had a very similar condition happen after one of the many Master Resets that were required after installing 2.064x11. A couple of more resets took care of it.

For what it's worth,

Paul,

I have seen your items 2 and 3, both persist after many resets so far. I noticed the BW and PBT not resetting correctly when changing the band register rather than actually changing bands.

For item 3 see my video on You Tube at

http://www.youtube.com/watch?v=-JuHwp0c6Lk

Would very much like to know if this is what you see.

My email to this group on 23rd February detailed what I have noticed except for the BW and PBT not properly resetting.

Wonder if there is an average number of resets, master resets, RAM clears that need to be done, think I'm up to about 50 of each so far.

Regards

Martin, HS0ZED

Isn't item 1 symptom 2 caused by the wrong mode being selected for the subreceiver?

Hopefully, option will be there someday for Orion subreceiver mode to automatically track main receiver mode.

hi barry

first i would like to say the new s/w is an overall improvement
just for me and few others some quirks have popped up..none of which will keep me from using the current version
and
so far multiple resets have not cleared them for me

regarding split mode..
well could be BUT if i was working someone split they are on ssb and i am cw and i have forgotten to deselect vox..the rig will hang in transmit...not a good long term rig safe mode.

or
in the way it happened to me

The way this happen to me was i was working a dx station i needed on cw in split mode and then got back into the ssb contest mode and forgot to set rig back to simplex mode..DUH..but it is a contest and sometimes we just forget.

i did have to power down the rig to clear the issue
i had tried to deselect vox but the radio did not respond
it just got corn-fused as did i ;-)

i think once the vox issue of symptom one is cleaned up symptom two will disappear

i think reporting repeatable items are an aid to John Henry and crew to help them debug ..

The TUNE should be about #1 or slightly less and the LOAD about #4. This is at 28.200 with a 50 ohm resistive load. This produces about 900 watts of output with 90 watts of drive.

I performed the upgrade to Ver. 2.064X11 a couple weeks ago and have yet to see any of the afore mentioned symptoms (1,2 or 3). I chased DX using split CW and SSB modes as well as locking VFO A and B together to effect diversity reception and the radio has worked as advertised with one exception. During the ARRL DX contest this past weekend when I pressed any of the buttons (band, antenna swap etc.) the screen went blank (raster but no pix) and the radio quit communicating with the computer. Power off/on would bring it back to normal but activating any of the front panel switches would again blank the screen and lose computer control (N1MM). I performed a master reset, correcting the anomaly and the radio has played fine since. I have no way of knowing what may have caused this issue but am not blaming the software; suspect it may have been RF related. So far classified as a could not duplicate (CND).

To this point I have been pleased with the operation of the radio post upgrade.

6744. Connecting Orion to HRD

Yahoo group: orion565 (2009 — 2013)

From: NewellC
Topic: 6744 Message: 6744

Here is the problem: I have used several serial to USB cables and many drivers but HRD will not connect with the radio unless I use COM1 with a straight through RS232 cable. With the serial to USB cable HRD gives a message to make sure the radio is turned on and not in memory mode. Once connected, when I connect to my computer using the 8 pin DIN to USB I get a sound card not able to communicate message. Also, in this configuration I key the radio every time something in my computer uses the sound card.

What am I missing here?

Thanks

Newell

Newell,

Go to Device Manager in Windows and see what port the USB adapter has been assigned. Then use that port number in HRD.

I've a couple of Serial-to-USB converter cables. Some work with some applications while I've found that others do not. Basically all Serial-to-USB converters are not created equal. The reason I have two is that one works with one application but not all, and the other one works with the preferred application but again, not all.

If Newell's suggestion doesn't work, consider a different brand/model of Serial-to-USB converter.

Newell,

Another idea came to mind. I had trouble with ACLog from N3FJP, but HRD worked fine. When I went to ports in Device Manager, I saw that I had a Prolific chip set in the USB to serial connector. I went to the Prolific web site and downloaded the latest driver for my adapter and after that all was fine. Give that a try.

Newell,
do you have DTR and RTS set to high in your program for this serial port? I know that is the only way DX4WIN will operate my Orion II. I set it right in the DX4WIN program.

Most problems with USB-to-serial cables that I have had are problems
with the drivers. Generally pays to make sure you have the latest drivers.

Yes, I too have found that to be an issue. Still haven't found drivers that work with all of the applications I use. Thus is the need to have a 2nd Serial-to-USB converter to run with one specific application. Grrrrrr

Frustrating!!!!! At the same time, I'm thankful that I use an old computer that does have a real RS-232 port. That solves all of the issues all of the time.

Most problems with USB-to-serial cables that I have had are problems
with the drivers. Generally pays to make sure you have the latest drivers.

Ya know, boys, I have a suggestion for you that may fix all this.

First, all of you like to operate cw, I'm assuming, along with rtty and perhaps some contesting via ssb as well.

Second, we're all interested in being fairly state-of-the-art in our shacks or we wouldn't be having this conversation.

Finally, we don't seem to mind spending some dough to do all this.

So. I use a microHAM microKEYER II. Not only does this little box integrate all those features, cw keying, voice keying, rtty, PSK, but it provides interface for DX4Win and any other program like HRD. And it does all this with a single USB connection to your computer.

It comes with all the connectors to integrate it to your Orion. It operates on any COM port you wish to establish and works with virtual COM port selection. It's bulletproof and works all the time, every time. microHAM has it figured out.

I PROMISE you, you'll come to love this little interface, and even though it's a bit pricy, it simply works, and the support is superb.

Check it out. All your headaches will cease.

Wrll, I ahve tried three (3) different USB to serial adaptrers including the one from Ten Tec. I downloaded the latest drivers. Still no workee. Had the local computer guru come over and he went away mumbling to himself.

The Prolific website has a disclaimer that they just sell chips and do not make cables and any problems need to be taken to the cable manufacturers. I am sick of fighting the adapters. I ordered a card that will add two more RS2332 ports to my computer.

I will take a look at the microkeyer.

Thanks to all who replied.

73,

Newell

With the serial to USB cable HRD gives a message to make sure the radio is turned on and not in memory mode. Once connected, when I connect to my computer using the 8 pin DIN to USB I get a sound card not able to communicate message. Also, in this configuration I key the radio every time something in my computer uses the sound card.

I've had good luck with FTDI USB serial ports interfacing my Orion with HRD
and N1MM Logger.

An RS232 card should be even better.

I used same interface cable I purchased for my K3 from Elecraft and my Orion II works fine with that cable,have no idea who makes it but it works anytime I open HRD with windows 7 64bits.Its a serial to USB cable.

I had issues with USB-COM cables made the from Prolific chip set also.
Someone recommended I try one from Byte Runner www.byterunner.com.
That solved my problems. I have since switched to a microham interface, the
makers of MicroKeyer, and that has had no problems either.

From: ac8ap
Topic: 6744 Message: 6757

I am using a Belkin USB to Serial adapter to go to the serial port. Then I use Ten Tec's USB to Transciever cable model 712 to go into the AUX I/O. I change the Menu / SSB / TX Audio source to AUX. This will allow me to key the rig and transmit and recieve through both cables for soundcard modes. I went into my sound devices in the computer settings and made Virtual Audio Cable the default for Playback and Recording. This is the Ten Tec USB model 712 cable. (I believe I got this information accurate for the posting) I am using two seperate cables attached between the computer and the Orion. I checked the properties on the usb to serial port adapter to see what COM port it is assigned and set that in the HRD program. Sometimes it does not recognize the rig and I have to turn the Orion off and back on then start the HRD program again and it works. Something strange there but I am not sure whether it is the rig or the HRD program.

6759. UPDATE ---- my issues list with 2.064x11

Yahoo group: orion565 (2009 — 2013)
Date: 2011-03-12 17:38:33 UTC
From: saukp
Topic: 6721 Message: 6759

hi all

As I promised to a few other with same issues, I decided to reload and try multiple master resets as was recommended by a few people

In an attempt to clear out the three issues I went thru the following sequence

1. Loaded stable version 2.062a doing two master resets and ram clear
2. Ran tests for the three issues and none were found

3. Loaded 2.064x11 doing two master rests and ram clear
4. Ran test for the three identified issues

As a result of the testing, all three still persist and are repeatable

Some one had recommended doing multiple master resets, so i did.

After doing 20 more master resets and ram clears

5. Ran tests again and the three issues still persist

Someone had mention I also checked for the BW/PBT display not updating to correct values when just going thru the same band registers.
yep..problem is there too.

I have not tested NB or NR functionality..so i have no comments there

I still like this version 2.064x11,It has a lot to offer and I think JH and Crew at TT have done a nice job getting the orion and orion II on same codebase and as close as possible operating alike.

Just needs a few tweeks for me.

In HRD Digital Master click on Program Options.

Click on Soundcard

Set Input device to Microphone (USB audio CODEC0

Set Output device to Speakers (USB audio CODEC)

My output db selection below that with the choices is set to 0dB I don't think I ever messed with that. This is how mine is set and I can work PSK using HRD and the Orion. I can send you screen shots if you need them to help. I don't think I can post them here.

I'm able to replicate this. Turning on VOX in cw mode mutes the main rx (not the subrx).

> Symptom Number 2 .. when operating split and not mode tracking rcv main in ssb mode and rcv sub is cw mode and is the xmit freq and vox engaged..when speaking into mike ..get a cw carrier and rig locks up in transmit mode..this requires a power down to clear

I can't replicate this. With tx and subrx (cw) on vfoB, the rig won't transmit using either VOX or PTT

> 2. BPT and BW not display updating to actual when switching bands
>

I can't replicate this either

Newell, All,

I use a Vivanco USB-Serial cable and have no problems under Windows or Linux. Requires a driver download for windows, and you may need to re-assign a USB port if your available COM ports are too high (i.e. COM21 etc). That is easily done in device manager.

Of interest, I use Xlog and Xdx under Ubuntu linux on an Acer Aspire One netbook.

Here is a link to the adapter:
http://www.vivanco-direct.com/Computer-Peripherals/Computer-Cables-554/USB-Cable/USB-SERIAL-ADAPTER

Regards

Mick

6765. OT: Finally an antenna for Topband (still having lots of fun using V1.373b5)

Yahoo group: orion565 (2009 — 2013)
Date: 2011-03-13 14:11:26 UTC
From: Mark
Topic: 6765 Message: 6765

Since my move to a new QTH some years ago I finally managed to get on the air on Topband. 100W at some 90ft 0.2mm dia wire, an ATU, groundrod and a handfull VERY short radials in just 1 direction DOES make QSO's. Shameless plugging: http://pa5mw.blogspot.com

thanks for all you great ops, pulling me out of the noise

Since I do CW only and never use the bandscope, V1.373b5 is still runnning. I like the way it is currently, especially the AGC structure.

Question: Not found any quirks yet,is there any benefit for me to try the new V2 in such a way it provides more qso's?

get Orion I unless you are sold on the color screen

I have the Orion II and can't see where there is a real need to have it unless you like the color display - seems to be more firmware updates for the Orion I than the II

both radios are fine

If I could I would also get a K3 for cw -- its a drop dead radio -- and you dont have to ge the 2nd receiver

THing I dont like about the Orions is the 2nd receiver suck

just my opinion

ive had the bad luck of a lighting strike, so now am faced with getting a new

rig, my orion is toast, does anyone have any ideas on how different the orion 2

and the omni are. i know of the phy diffs, wondering if the rcvr is close to

equal, i dont use the second rcvr in the orion anyway, so that is no selling

point for me. any input is welcome. ron ne0x

Hi Ron ... At one time or another I have had the OmniVII, the OrionI and I now own an OrionII. Having had an opportunity to try all three, I have an opinion but it will probably be different than many other hams that will write you but here's what I found. The OmniVII is OK but I was not impressed with the receive audio and since that's what I get from the radio, I did not keep it very long. It's pretty though! Next, I got a great deal on an OrionI and that is a real radio. It was probably the best radio that I have ever had. I could find little fault with it except the display was not impressive. I contacted TT and ask about the blue/silver display that they have on the Jupiter and surprisingly it IS available for the OrionI and the cost is only $150 plus installation labor. That would have made a huge difference! About a month ago I ordered an OrionII and it really has it all, including a big price. I do not see much difference in the operation of the I and II except the display and TT was very honest at telling me what I would find. The OrionII will never leave my shack! BUT if I had it to do all over again I would find a nice, well adorned, OrionI and have that new display put on and with the money left over, I would take a nice vacation! I am seeing a lot of OrionI's and they are a bargain!

Hi All,

Pretty well stated Michael, and I think it's accurate. I had an Orion II, but it probably wasn't sufficiently better than the original Orion to justify the cost differential. I now have a K3, and it's just flat a better radio. However, not everyone would agree, and for a variety of reasons. It's pretty easy to "over-buy" when it comes to ham gear (and lots of other stuff too!). But don't beat yourself up too much if you do it. You have lots of company out there.

Again - I would say a lot is about marketing and both companies do a good job doing that with user groups

The best of all worlds is to use the Orion for SSB; not to say it is not good for cw

I will prob get the K3 by end of this year --- will do the extra filtering -- drop dead great cw radio ALSO K3 has the built in packet and rtty   the Orion does not

none of these rigs are cheap

my current Orion II would say be about $4500 today market, maybe a little more since I got all the filters, fan, mike etc

if you just want to try the Orion do the Orion I and get the screen upgrade like someone else said

but remember
the Orion 2nd receiver sucks and it is not good for split operation in my opinion

Barry I wont disagree on the diversity but the sub receiver in my old FT 1000mp Mark V was better in opinion

I am not saying the radio is a loser -- I use it 80-90% on cw

But

it does not have the same nice gain or receive as the main receiver
too bad Ten Tec did not address that

I would say the rig has other good features but the K3 will beat it on the 2nd receiver infact
when I had the IcomPro II it did better on the 2nd receiver than Ten Tec

all this is a matter of subjective opinion to the reader

Still value your opinions a lot and respect your wisdom

The second receiver in my Orion is what makes it the great DX-working tool that it is. Agreed, the sub-rx does not perform nearly as well as the main RX. However, when I'm trying to work DX, I use the Main RX to pull the DX out of the noise + QRM, and I use the Sub RX linked to VFO-B with my transmit frequency to find where he is working in the pile, and then place my transmit signal. I don't need all the power of the Main RX for that purpose. Would it be nice to have? I suppose, but I'm not sure I'd use it much because that wouldn't suit my purposes as much. Now, if you're going to use it as a diversity RX arrangement on 160m, then the differences in the Main and Sub become more of a problem. Since diversity reception on 160m is not in my plans for a long time, I will continue enjoying my Orion and both its receivers!

Well, I wouldn't go so far as to say the sub RX on the Orion "sucks", but it definitely isn't nearly the RX as the main one. That's one of the reasons the K3 has a leg up on the Orions--the sub RX is exactly the same as the main RX, and both can be filtered to your preference. You can get true diversity reception on the K3, etc. However, that's a "gee whiz" feature to many, and not something everyone takes a lot of advantage of--or needs to. Nonetheless, you are absolutely right that the Orion's sub RX is maligned a good bit more than it deserves. It's certainly competent, but just not great.

Ok the second receiver ain't what it should be, but we knew that going in.

But to say that the Orion II isn't great on CW is simply wrong, Michael, there is no better cw rig on the market. Period. The break-in is flawless, and drives a full break-in amplifier like no other radio I've used. I've used Kenwoods, Icoms, Yaesus over the years, and nothing comes close to the Orion II for a hard-core cw op.

With the roofing filters in place, I cannot understand how you can feel differently, although, I'll be the first to admit that it's certainly a personal preference kinda thing.

As far as split operation is concerned, I use it every day, and I'm at the top of the Honor Roll. I find it works just peachy for all uses, cw, ssb and RTTY. Proper utilization of the fabulous adjustable AGC responses makes that second receiver completely adequate for my uses. And I especially appreciate it on 160 during noisy conditions, split or not.

YMMV

Ok the second receiver ain't what it should be, but we knew that going in.

But to say that the Orion II isn't great on CW is simply wrong, Michael, there is no better cw rig on the market. Period. The break-in is flawless, and drives a full break-in amplifier like no other radio I've used. I've used Kenwoods, Icoms, Yaesus over the years, and nothing comes close to the Orion II for a hard-core cw op.

With the roofing filters in place, I cannot understand how you can feel differently, although, I'll be the first to admit that it's certainly a personal preference kinda thing.

As far as split operation is concerned, I use it every day, and I'm at the top of the Honor Roll. I find it works just peachy for all uses, cw, ssb and RTTY. Proper utilization of the fabulous adjustable AGC responses makes that second receiver completely adequate for my uses. And I especially appreciate it on 160 during noisy conditions, split or not.

YMMV

I'll throw my 2 cents worth in here.
I own both the Orion 2 and the Omni 7.
I sold my K3 because I just did not like the radio.
Of the three I'd want the Orion 2 if I could only have one.
Nothing wrong with the Omni but it is not as nice as the Orion in my estimation. The Omni audio quality is good, certainly much better than the K3, but it is not up to that of the Orion.
The Omni receiver is nice but again not up to what is available in the Orion. My understanding is that the second receiver in the Orion 2 is basically the Jupiter receiver, not equal to the Omni or the main Orion receiver but not exactly terrible......
No Kool-aid here just my favorite radio.

I love all the attention and comments I generated

Remember I own the ORion II and invested it. Hey my seond rig will be K3 no doubt about that. I also worked a lot of dx with it but it's time to test deeper water.

I will say the knobs are sure purdy.
Just kidding

Thanks for all the comments but still say Ten TEc could have better with the second receiver for the price

IMHO

6786. Orion 1 problem??

Yahoo group: orion565 (2009 — 2013)
Date: 2011-03-14 01:49:48 UTC
From: Jeff Walker
Topic: 6786 Message: 6786

I have a small issue with my Orion 1. On 12, 17 & 20 meters when you first turn the rig on the ssb audio is "garbled" for 3 to 4 minutes. After the short warm up time it's clear. It only does it when you first turn on and only for the short time. I've never thought much about it since it always clears up but thought I'd toss it to the group for any ideas.

Based on size, performance and features, the Tentec Eagle will top all of them. The receiver is equal to the Orion and Orion II. The Eagle has better audio than the K-3. With the built-in tuner and hardware noise blanker it is less 1/2 the price of the Orion II. Likely one won't be able to tell the difference in receiver performance between the Orions and the K-3 and the Eagle.

I have both the Omni VII and the Eagle on the desk. The Eagle wins every time on receiver performance.

If you need lots of features and whistles and bells then expect to pay more $$$ for no more performance.

I up graded from a Omni VI+ to the VII to the Orion II. The difference between the VII and the Orion I or II is night and day. Skip the VII

I like big radios too. My big ones are my Hammarlund HQ-170 and a retired broadcast transmitter weighing in at some 1200 lbs. Nice 160M and 75M station.

Yes, the Orion II is a fine radio. Works well, lots of features although a bit pricey.

Many hams today do not have the space to dedicate to their radio hobby. The Eagle fits nicely and provides the performance as well and it is in the "under $2K" price range.

Well, I have an Omni VII and an Orion II. The Orion wins every time. I just recently picked up a Kenwood TS-590s, and I'll be honest, I think it beats the c#@* out of the Omni VII but still has to go some to beat the Orion II. Sherwood Engineering still rates the Orion as one of the top receivers in the group.

6795. Flex-5000 vs orion 2

Yahoo group: orion565 (2009 — 2013)
Date: 2011-03-14 21:51:22 UTC
From: Hector Padron
Topic: 6766 Message: 6795

And now that the group has been comparing radios, does anyone has at home the O2 plus the Flex-5000 and could let us know how they compare each other? I personally been thinking about to purchase a Flex5000A but I will like to know if is better or equal than my O2?Thanks in advance for your possible answer.

Well, I have an Omni VII and an Orion II. The Orion wins every time. I just recently picked up a Kenwood TS-590s, and I'll be honest, I think it beats the c#@* out of the Omni VII but still has to go some to beat the Orion II. Sherwood Engineering still rates the Orion as one of the top receivers in the group.

From: k1fpv
Topic: 6766 Message: 6797

In my case, I am speaking from actual hands on experience. In my shack, I have the following rigs: anm Orion II, Omni VII, Jupiter, 2 Argonaut V transceivers, and a Ten-Tec 526 6 & 2 meter transceiver, Kenwood TS-2000, Kenwood TS-590s, Yaesu FT-2000, and a K2. My statement stands!

6798. Re: [orion565] Flex-5000 vs orion 2

Yahoo group: orion565 (2009 — 2013)
Date: 2011-03-14 22:44:28 UTC
From: Larry Menzel
Topic: 6766 Message: 6798

Hi, Hector,

Yes, I have both in my shack and use them extensively. I'll give you my impressions of both radios:

Orion II. I have had this radio for several years, bought it new from TT. It has all the filters in it. I find it to be an exceptional performing radio for all modes. I am primarily a cw operator, and use it with my Alpha 91b amp. It works superbly full QSK with the Alpha. I used it with my previous amp, and Acom 2000A and it worked flawlessly with that amp as well. The keying loop arrangement with both amps is very good. I also use it for RTTY and enjoy it there, as well. I don't think I have to extol the virtues of the 566 here. It is a straightforward rig that you can learn to use quickly and then start to tweak as you get used to the AGC settings and the various voice shaping parameters. I love my Orion II, it's certainly one of the best "box" radios on the market.

Flex 5000A: I purchased this about two years ago, and I'm still in the process of learning how to use the radio. It has a very long learning curve, and each rev of software brings changes to the operation of this rig. You must accept this fact from get-go. You're going to be dinking with it all the time, either as an adjustment, or a software change or some feature that gets added. Because EVERYTHING on the Flex is adjustable or customizable for the user, it does take some time to get the hang of it. It's a very sophisticated piece of equipment.

Receiver(s): The standard 5000A comes with one receiver, a second identical receiver is available for about $650 (two VFOs, naturally) but having said that, each VFO is exactly the same. If you go split with it, you can have the same or different receive capabilities/filtering etc., with each. It's really very good. You can go to many resources on the net to get all the technical specs. I like this one www.sherweng.com Here, Rob Sherwood does an extensive receiver testing report for all the radios on the market. Orion and Flex are a hair's breadth apart. I think the Flex receiver is even better than the Orion II, but not by a lot. Anything I can hear on the Flex I can here with the Orion. The difference comes in the filtering capabilities of the Flex, which allows you to cut down a cw signal to 25hz with perfect clarity.So on noisy split operation it can be a real advantage. Splitting the receiver is a one-click action...you can vary the volume with a slider...works pretty slick. I have to say it, the receiver is spectacular in thick going, like a cw contest. My Orion II is very good here, too, but be absolutely truthful, the Flex handles strong adjacent signals better than the Orion II.

Operationally, it's really not difficult to get on the air and up and running. The latest Beta version of the software is Power SDR 2.0.20. This

rev has REALLY stepped the radio up in many ways, especially in respect to how it handles CW. Prior to 2.0.19 RC1 (RC for release candidate) the cw was only marginally acceptable. You could work semi-break in but that was about all. It worked OK, but not great. NOW however, it's become extremely good, and there's no latency issues that I can feel or tell. This is a huge improvement. You can work QSK at 40wpm and it works great. I love it. I have yet to hook it to my Alpha yet, but that's gonna happen soon.

As I mentioned, everything on the radio is adjustable, including all audio settings. There is a built in 3 or 10 band tx equalizer for voice tailoring, as well as a 3 or 10 band RX equalizer for receive audio. These are very cool. All filters are vastly adjustable and customizable for the operator. It's really your radio to set up exactly how you want.

On SSB, the Orion audio is tough to beat. Flex is good here, too. Both rigs allow for a wide latitude for transmitted audio. Each has excellent receive audio characteristics and I can't choose between them on SSB. I like them both.

Digital modes: This is a second level of expertise in managing both the radio and additional software. because there are no external boxes, like microHAM or anything else, Flex uses virtual audio cable technology. This is not difficult to set up and works quite well with something like MMTTY. Here there are extra utilities to bring into play and there is a fairly steep learning curve to get all things working together like N1MM or a logging program like DX4Win or HRD.

Noise reduction: Sorry TT, but Flex wins this one hands down. The noise reduction on the Flex is significantly better, without losing receive signal integrity. In my opinion, TT has not really done a good job with this. The multiple noise reduction tools of the Flex are much better. So if you live in a really noisy environment (I don't) then maybe you would really appreciate how well it works. Orion's is good but Flex is much better.

Another observation I would make is that one monitor is not enough for the Flex. If you're going to contest or even run your logging program this takes another level of trial and error to get running...I know because I'm doing it now. Plan on using two monitors right away. One for the radio, one for additional applications. There is a bit of frustration that can accompany the Flex when getting all the various applications running, just be aware of it.

I'd be happy to carry on with you privately, but I think that's enough for the reflector.

In my case, I am speaking from actual hands on experience. In my shack, I have the following rigs: anm Orion II, Omni VII, Jupiter, 2 Argonaut V transceivers, and a Ten-Tec 526 6 & 2 meter transceiver, Kenwood TS-2000, Kenwood TS-590s, Yaesu FT-2000, and a K2. My statement stands!

From: Bob McGraw - K4TAX
Topic: 6766 Message: 6802

Reading the most recent Sherwood Engineering Receiver test data report, for Narrow Spaced Dynamic Range, the Eagle is the next in line just below the Orion.

Basically any receiver with a dynamic range of 90 dB or better is likely not to be noticed as any better than one having a better or higher dynamic range. The Eagle comes in at 90 dB while the Orion is at 93 dB with the Orion II at 95 dB. The K-3 is at 95 dB, 96 dB or 101 dB depending on configuration of filters.

Again from my viewpoint, there's a lot more to receiver performance than the one factor sited in the Sherwood report. It takes a lot of research to find one satisfactory to each persons unique needs and operating condition and preferences.

Yes, I agree the Eagle or the original Orion or the Orion II has a superior receiver as compared to the Omni VII.

Well, I have an Omni VII and an Orion II. The Orion wins every time. I just recently picked up a Kenwood TS-590s, and I'll be honest, I think it beats the c#@* out of the Omni VII but still has to go some to beat the Orion II. Sherwood Engineering still rates the Orion as one of the top receivers in the group.

From: Bob McGraw - K4TAX
Topic: 6766 Message: 6803

This is where I believe that Tentec has a winner in its Marketing and Sales programs. They offer a 30 day trial period. This allows a person to use the radio, at their QTH, on their antennas for 30 days. If one doesn't like it, send it back and pay the shipping charges. I'm not aware of any other company that provides this feature or convenience.

I agree, hands on, on my antennas is the way to go.

Yeah but reading all the reviews does not equal actual on-hands operation

besides

the ant is really 60% of working any station

Well, I have an Omni VII and an Orion II. The Orion wins every time. I just recently picked up a Kenwood TS-590s, and I'll be honest, I think it beats the c#@* out of the Omni VII but still has to go some to beat the Orion II. Sherwood Engineering still rates the Orion as one of the top receivers in the group.

Hi Hector ... I also have an Orion II and a Flex 5000A sitting side by side. I agree with Larry that the basic capabilities are somewhat equal. The difference is in things like the pan display of the Flex. It's very valuable and the Orion just doesn't have that feature, however it doesn't take a computer geek to run an Orion! If you buy a Flex, be sure that you have a good fast computer to run it. It runs on a Dual Core (Intel) but really needs a Quad core processor to make it shine. Since your computer is half of the radio, skimping on the computer can make the 5000A a bad choice. The Orion doesn't require a computer or a geek. Good luck with your choice. Larry W8ER

From: Barry N1EU
Topic: 6766 Message: 6805

This is the coolest SDR implementation I've seen yet, using a Flex 5000 with Touch Screen monitor and aux tuning knob. Select 480P resolution and watch it in Full Screen viewing mode:

http://www.youtube.com/watch?v=ZvZLaIZi6xQ

BTW, the Orion can do beautiful pan displays just like this using LP-PAN along with the VE7TK if output mod (but you need a fast pc). That would be my choice. I'm waiting on these SDR's to at least implement direct sampling receive.

Dear Larry,thanks a lot for your very detailed explanation,it buy me completely.Now I know exactly how the Flex will work compared to my O2,I will definively buy one soon,maybe I will get in touch with you to set it up.We'll keep in touch,I will save this email,73

Hi, Hector,

Yes, I have both in my shack and use them extensively. I'll give you my impressions of both radios:

Orion II. I have had this radio for several years, bought it new from TT. It has all the filters in it. I find it to be an exceptional performing radio for all modes. I am primarily a cw operator, and use it with my Alpha 91b amp. It works superbly full QSK with the Alpha. I used it with my previous amp, and Acom 2000A and it worked flawlessly with that amp as well. The keying loop arrangement with both amps is very good. I also use it for RTTY and enjoy it there, as well. I don't think I have to extol the virtues of the 566 here. It is a straightforward rig that you can learn to use quickly and then start to tweak as you get used to the AGC settings and the various voice shaping parameters. I love my Orion II, it's certainly one of the best "box" radios on the market.

Flex 5000A: I purchased this about two years ago, and I'm still in the process of learning how to use the radio. It has a very long learning curve, and each rev of software brings changes to the operation of this rig. You must accept this fact from get-go. You're going to be dinking with it all the time, either as an adjustment, or a software change or some feature that gets added. Because EVERYTHING on the Flex is adjustable or customizable for the user, it does take some time to get the hang of it. It's a very sophisticated piece of equipment.

Receiver(s): The standard 5000A comes with one receiver, a second identical receiver is available for about $650 (two VFOs, naturally) but having said that, each VFO is exactly the same. If you go split with it, you can have the same or different receive capabilities/filtering etc., with each. It's really very good. You can go to many resources on the net to get all the

technical specs. I like this one www.sherweng.com Here, Rob Sherwood does an extensive receiver testing report for all the radios on the market. Orion and Flex are a hair's breadth apart. I think the Flex receiver is even better than the Orion II, but not by a lot. Anything I can hear on the Flex I can here with the Orion. The difference comes in the filtering capabilities of the Flex, which allows you to cut down a cw signal to 25hz with perfect clarity.So on noisy split operation it can be a real advantage. Splitting the receiver is a one-click action...you can vary the volume with a slider...works pretty slick. I have to say it, the receiver is spectacular in thick going, like a cw contest. My Orion II is very good here, too, but be absolutely truthful, the Flex handles strong adjacent signals better than the Orion II.

Operationally, it's really not difficult to get on the air and up and running. The latest Beta version of the software is Power SDR 2.0.20. This rev has REALLY stepped the radio up in many ways, especially in respect to how it handles CW. Prior to 2.0.19 RC1 (RC for release candidate) the cw was only marginally acceptable. You could work semi-break in but that was about all. It worked OK, but not great. NOW however, it's become extremely good, and there's no latency issues that I can feel or tell. This is a huge improvement. You can work QSK at 40wpm and it works great. I love it. I have yet to hook it to my Alpha yet, but that's gonna happen soon.

As I mentioned, everything on the radio is adjustable, including all audio settings. There is a built in 3 or 10 band tx equalizer for voice tailoring, as well as a 3 or 10 band RX equalizer for receive audio. These are very cool. All filters are vastly adjustable and customizable for the operator. It's really your radio to set up exactly how you want.

On SSB, the Orion audio is tough to beat. Flex is good here, too. Both rigs allow for a wide latitude for transmitted audio. Each has excellent receive audio characteristics and I can't choose between them on SSB. I like them both.

Digital modes: This is a second level of expertise in managing both the radio and additional software. because there are no external boxes, like microHAM or anything else, Flex uses virtual audio cable technology. This is not difficult to set up and works quite well with something like MMTTY. Here there are extra utilities to bring into play and there is a fairly steep learning curve to get all things working together like N1MM or a logging program like DX4Win or HRD.

Noise reduction: Sorry TT, but Flex wins this one hands down. The noise reduction on the Flex is significantly better, without losing receive signal integrity. In my opinion, TT has not really done a good job with this. The multiple noise reduction tools of the Flex are much better. So if you live in a really noisy environment (I don't) then maybe you would really appreciate how well it works. Orion's is good but Flex is much better.

Another observation I would make is that one monitor is not enough for the Flex. If you're going to contest or even run your logging program this takes another level of trial and error to get running...I know because I'm

doing it now. Plan on using two monitors right away. One for the radio, one for additional applications. There is a bit of frustration that can accompany the Flex when getting all the various applications running, just be aware of it.

I'd be happy to carry on with you privately, but I think that's enough for the reflector.

From: Hector Padron
Topic: 6766 Message: 6807

yes Larry,I do understand that and precisely what I will do is take my home PC wich is a dual core at 2.5Ghz with 4MB RAM to a friend of mine qth to hook it up to his Flex5000 to see if it runs well,then if it does,I am ready to purchase the Flex5000 for me as well.I talked to Matt at Flex company and acording the info about my PC that I provided him,he said its going to be ok,we'll see,thanks for the good advice.

Hi Hector ... I also have an Orion II and a Flex 5000A sitting side by side. I agree with Larry that the basic capabilities are somewhat equal. The difference is in things like the pan display of the Flex. It's very valuable and the Orion just doesn't have that feature, however it doesn't take a computer geek to run an Orion! If you buy a Flex, be sure that you have a good fast computer to run it. It runs on a Dual Core (Intel) but really needs a Quad core processor to make it shine. Since your computer is half of the radio, skimping on the computer can make the 5000A a bad choice. The Orion doesn't require a computer or a geek. Good luck with your choice. Larry W8ER

[Non-text portions of this message have been removed]

6808. Re: Flex-5000 vs orion 2

Yahoo group: orion565 (2009 — 2013)
Date: 2011-03-16 21:01:58 UTC
From: k1fpv
Topic: 6766 Message: 6808

Really nice job Larry. It looks like you have done a superb comparison of the two radios side by side. If I ever went for a Flex 5000A or perhaps even another model yet to be released, I'd buy a new computer with plenty of "horsepower" to run it.

Thanks for the input!

6809. Re: Connecting Orion to HRD

Well, I got the new card with two RS232 ports in my computer and all is well in hamdom. I think I am through fighting the adapters. They just don't seem to be reliable and repeatable. Thanks to all who replied.

I've had my Orion now for two weeks and am having the love affair of my ham life. This radio is so far above anything I've had in the shack before. I have barely begun to adjust anything beyond factory presets and am very impressed with the receiver capabilities. The internal tuner is awsome and is tuning an antenna on 80M that my 746PRO couldn't. I am hearing stations I couldn't before and am getting some awsome reports. I'm sure I am preaching to the choir here, but this is a keeper.

I was in the process of looking for an Omni VII but there had been none being listed for a few weeks when this Orion came up. Since buying it there have been three or four Omnis come up for sale. I'm thinking I was meant to have an Orion. I can live with that.

>
> Here is the problem: I have used several serial to USB cables and many drivers but HRD will not connect with the radio unless I use COM1 with a straight through RS232 cable. With the serial to USB cable HRD gives a message to make sure the radio is turned on and not in memory mode. Once connected, when I connect to my computer using the 8 pin DIN to USB I get a sound card not able to communicate message. Also, in this configuration I key the radio every time something in my computer uses the sound card.

6810. New owner of an Orion II - RX AGC issues

Yahoo group: orion565 (2009 — 2013)

Topic: 6744 Message: 6810

Hi All,

Got an Orion II today (used). It was already updated to the latest firmware. I find the AGC has a lot of pumping on strong signals on 75 meters.

Also seems the S meter is out of calibration. It reads a lot higher than my 7700 side by side and signals that are over 20 over S9 seem to easily jump to 50+ over S9.

Lots of static crashes tonight and running AGC on slow with following settings:
Hang 0.0 s
Decay 10 dB
Threshold 1.50 uV

I've tried adjusting the AGC parameters and haven't had any good success improving AGC response. Anyone have any suggestions?

BTW, connected my W2IHY equipment through the rear connector and getting excellent reports. Just had to raise the gain out of the EQ Plus higher since the rear input requires more lvel than the front mic jack.

Don't forget to back off on the RF Gain. Running it full-out can cause some of that pumping you are describing.

Thanks to all for the reply. There is definitely a learning curve regarding rx gain and AGC settings. Definitely not a radio you can take out of the box and have working properly without adjustments.
For medium settings I am using hang 0.12, decay 20 dB, and threshold 1.30 uV. This gives me balance between weak signals and strong stations.

With that said..... I am wondering if there is not an alignment issue. With both the main and sub receiver at same AGC settings the sub receiver does not have the pumping as bad as the main receiver. Also the S meter seems to be not calibrated as signals are higher than my Icom 7700 and Flex 5000A. Also strong signals seem to jump from around 10 over S9 right up to 40+. I'll verify this tonight with my Aeroflex 2975 service monitor.

It seems the radio has excessive IF gain in a stage where the RF Gain control has no real effect.

Is there a service manual available to purchase?

Dave,
I've have a spreadsheet with a few different Orion II owner's settings for AGC and virtually everything else that I'd be glad to email to you. Is the RocketNJ@... a good address to send it?

I just got an Orion II also
Would you send me the spreadsheet also.
The email listed is good for me.
Thank you.

Dave,
I've have a spreadsheet with a few different Orion II owner's settings for
AGC and virtually everything else that I'd be glad to email to you. Is the
RocketNJ@... a good address to send it?

Hi Dave, I have also been reading the mail on AGC with the Orion2, could I also get a copy of your spreadsheet data?
Thanks 73 de Dave KR4U

Topic: 6744 Message: 6820

Hi, Dave, and welcome to the wonderful world of Orion!

As AC5AA said, be sure to turn the RF gain back about 70. Over driving the receiver can cause all that popping and crunching you hear. Don't forget to set the B VFO gain back to about 70 or 75 as well.

Also, make sure that you have not accidentally activated the preamp down in the bottom right of the screen area. This is easy to do and magnifies all that noise, as well.

As for AGC settings, let me pass along to you some wisdom I received some years ago when I first started using an Orion. I find that the AGC threshold control makes a lot of difference when changing AGC settings from slow through program. I like to have a good a signal to noise ratio as possible. Since I don't hear as well as I used to these settings make a significant difference when tuning, especially in noisy situations. I work mostly QSK CW and I like to have the receiver quiet between the elements as I listen. I also like the receiver quite on SSB QSOs as well. So, here's how I have set up my AGC options. Before you begin adjusting these, make sure the RF Gain is at 100. Watch the S meter as you set the threshold. Switch to 10 meters or somewhere where it's quiet. Then turn the RF Gain back to 70 or so when you're done.

SLOW:
Hang: 1 second
Decay: 10 dB/s
Threshold:11uV (About S6 on the S meter)

MEDIUM:
Hang: 0.5 Seconds
Decay: 20 dB/s
Threshold: 5uV (about S5 on the S meter)

FAST:
Hang: .02 seconds
Decay: 80 dB/s
Threshold: 1.4uV (About S2.5 on the S Meter)

PROG:
Hang: 0.1 seconds
Decay: 200 dB/S (and you may want to try values up to 1000 or more--your choice--I run mine at about 800)
Threshold: .75 (About S2 or so on the meter)

I set my AGC Slope to 2:10 db.

I use the SLOW settings when conditions are pretty good and work down as conditions deteriorate. Having THRESHOLD available in the AGC settings makes it very easy to quickly set the best performance for any condition. You can still use the RF Gain to incruease or reduce RX gain further as required. This, IMHO, is one of the most desirable features of the Orion.

Having said all this, none of these settings are anything but a suggestion. One of the great things about this radio is that you can truly customize it for your location, operating conditions and personal abilities.

These, at best, a starting point for you to begin customizing the radio for you. I love that.

As far as the S Meter readings are concerned, they are dependent upon the signal level, of course. So in the above example, if you're listening to a station in the "Slow" AGC position, signals under about S6 are not going to move the needle. If the signal is over the S6 reading then you'll get a better indication. However, in the PROG position, you'll get more accurate S meter indications.

I know, it's different from most radios out there, but remember, most of the time we give 599 anyway, so I don't see where S meter readings are really all that important anyway...IMHO. ;-)

Good luck. BTW, concentrate on all the marvelous things the radio can do, and don't get hung up on it's quirks...and there are some.

Larry, W0PR

Thanks to Lee, WA3FIY who sent me this stuff in the first place.

Pardon a dissenting voice, but IMHO all this attention on AGC settings is a bunch of hooey. Way back in the days of firmware that none of us are using any longer, you DID have to fool with AGC settings because RF Gain settings acted independently of AGC Threshold. But then they changed the dsp gain control so that RF Gain acted on the AGC Threshold. Just set AGC Threshold to a low value (1uV) and leave it there. Then, do this:

1. Turn off your preamp and turn RF Gain to 100
2. Tune in a very strong signal and turn up AF Gain to the maximum loudness you'll be comfortable with. For my headphones, that's about 75%. Leave your AF Gain at this setting all the time - don't touch it - ever
3. Turn RF Gain down till you just hear background band noise. You're done. Make small adjustments to RF Gain depending on strength of signal you've tuned in.

Hi All,

Update on my Orion II AGC issues.

I decided to load older versions of firmware to test AGC with different releases. After each load I cleared the RAM and did a master reset. I am now using 2.041XT beta release and have the AGC set to RF AGC. The AGC is a lot better. with slight tweaking of the settings I have very acceptable receive.

Then upgraded to 2.044a and did the RAM clear and master reset. Selectable AGC option (RF or AF) is no longer an option. RX audio on strong signals starts to sound very loud with echo and distorted around the edges. This is with adding 12 dB attenuation and RF gain around 70. With 2.041XT I could run no attenuation and RF gain at 100 without the audio sounding like that. So sticking with 2.041XT for now.

Mike,
I don't own an Orion and haven't used one so I can't say if the settings for the Orion II that I posted to the discussion list are the same as the Orion.

Ed,

Drop me a line at w0pr!(at)arrl(dot)net and I believe I can assist you. I'll give you my phone number in a private email.

I'm also good on QRZ.com.

I have MKII and my Orion working great.

6831. Orion Modes

Yahoo group: orion565 (2009 — 2013)
Date: 2011-03-29 17:09:41 UTC
From: NewellC
Topic: 6831 Message: 6831

Being a new owner of the Orion I am trudging up the steep learning curve. What are the modes UCW and LCW and when would you use them? No other radio I have owned has had these modes. I always thought CW was CW.

Thanks

Newell

Upper sideband CW (UCW) and lower sideband CW (LCW). Other rigs call
them CW and CW-Reverse, but don't tell you which side of the carrier
each one is. With Ten Tec, you know what you are getting.

I always use LCW for all bands. Scott from TT does a nice job explaining
the modes on a utube video.

You can sometimes switch between UCW and LCW to move interference around to where it is easier to work around. Personally, I just use LCW because that's what I'm used to from ICOM and earlier TT radios. Otherwise, I don't think it makes any difference other than which way signals appear as you tune up the band. (if you get what I mean!)...

I think it is a matter of choice. I use UCW on 30 meters through 10 meters. Then I use LCW for 160 through 40 meters to go along with the normal SSB modes.

Flip a coin if you can't decide. I find the Orion II works great on CW with either selection!

One other way to view the two modes:
In UCW when one tunes down in frequency across a carrier the tone increases in frequency.
In LCW when one tunes down in frequency across a carrier the tone decreases in frequency.

Either one gives the correct CW off-set, depending on sidetone frequency choosen, for receive. It will make no different to the operator on the other end.

From: Jim
Topic: 6839 Message: 6839

Sorry, no Orion here. Friend has one and I love it. I use LCW because it makes the computer scan via Digipan to move down (left) when I lower the frequency and up (right)when I move up in frequency. Works for me.

Good morning Newell,

Well, I always operate LCW...there's a difference int he sound and I prefer it. Honestly, I'm not sure...my Flex 5000 also offers LCW and UCW. In most cases, I think it's just a matter of preference, and as long as you're zero beat with the other station, I don't think it matters which choose.

Technically, it would seem logical that the selection of one or the other determines whether your actual transmitted cw signal is sent on the lower or upper sideband of a given frequency. So, for example if the station you're listening to is transmitting right at 14.005, if you were to respond to him on LCW your actual transmitted signal would be outside the band. By running the radio in UCW, your signal would be above the band edge, and therefore, legal.

OK, you smart people out there, give us the real reason! I'm dying to know also.

Not so - that works on SSB, and too many contesters don't pay attention to band edges and should. But on CW, your transmit frequency is listed on the readout whether you are in UCW or LCW. What it does is swap the receive offset so that you're listening to your offset frequency choice, not your "zero beat". (By "zero beat" I mean listening exactly on the transmit frequency where you will hear a 0 Hz signal - or, I should say, where you WON'T hear it!) Signals that sounded "higher" in pitch in LCW will sound lower in UCW, and vice versa. Meanwhile, your transmitted signal is on the indicated frequency. Yes, you still need to provide some margin to assure your CW signal is inside the band, but 100 - 200 Hz should be more than enough for that given the calibration accuracy and distortion characteristics of the Orion. In my own use, I never go below 500 Hz above the lower band edge on CW - I like to play it safe.

OK...As I said, I was venturing a guess, so I'm happy to accept your comment as accurate.

So I guess it does come down to liking what you hear, rather than making a big difference where you're transmitting.

I get it. Thanks for the input. Sometimes it takes a dumb answer to get a smart one.

So noted.

And I still maintain that some of the software packages out there handle this differently than our Orion's do, and that if they're using some kind of SSB derivative(?) to generate their CW signal, they could very well be out of band.

YMMV.

6845. FS: 253 Antenna Tuner, 311 Level Converter, 253-311 Cable, 253 Manual

Yahoo group: orion565 (2009 — 2013)
Date: 2011-04-05 17:02:58 UTC
From: Edward A. Feustel
Topic: 6845 Message: 6845

I have acquired a Palstar BT-1500A for my 600 ohm centerfed doublet and have decided to relinquish my 253 Auto tuner setup for my Orion 565/Centaur.

The package connects an Orion 565 or an Orion 566 to a 253 Auto Antenna Tuner. The Ten-tec 253 is in good working condition. The left hand upper corner of the 253 is slightly depressed and needs a spot of Ten Tec gray paint. It cannot be seen from the front. No power supply for the tuner nor keying loop cables are included. Photos of the tuner and 311 as well as the serial number of the 253 are available on request.

The cable from the Ten-tec 311 to the 253 was manufactured by Riley Accessories and replaces a 236. It has an extra wire in it that enables the antenna tuner for the segment at 6o meters.

Cost of the package is $650 plus shipping plus insurance via Postal Money Order or Paypal. I will not split elements of the package. Be certain that you understand the memory limitations of the 253 before you buy it.

From: Edward A. Feustel
Topic: 6846 Message: 6846

Ten-tec Engineering,
After a master reset the keyer was turned on.
I have straight key and vibroplex connected to the
port formerly dedicated to direct operation (not using
the built in keyer). I was surprised yesterday when
pressing the straight key produced a series of dots!

It is very handy to use the straight key for "final" tuneup on CW.
In the next version, please revert to the old scheme
as described in the manual.

Thanks and 73.
Ed, N5EI

From: Robert Mcgraw
Topic: 6846 Message: 6847

As I recall, and the way it works on the Eagle and the Omni VII, when the radio is powered up it "reads" the key jack for device configuration. If a bug or straight key is plugged in, it reverts to the straight key mode. However, if the radio is powered up and then a straight key is plugged in, the radio will not read the key jack and reverts to the mode that was read when the radio was powered up.

Thus, plug in the key and then power up the radio. All should be correct.

OK this must be something related to the code in the latest version for the Orion. I agree, it needs to be changed so that it reads the Key jack at turn-on. Or better yet, if the internal keyer is ON then it should expect the Key jack to be configured accordingly. Then simply turning off the internal keyer the Key jack should be for a bug or straight key or external keyer.

Dario,
I have the Orion II, so take my comments with that in mind. I never run the hardware noise blanker although I will occasionally use the software NB. I put my RF Gain between 60 and seventy, usually closer to 60, and then increase the volume as needed. Some users put the volume all the way up, and use the RF Gain for volume, but I prefer my own approach. You'll find on the list serve yahoo page a document put together by several of us showing our various settings for DSP, gains, etc. The factory default settings for DSP are terrible, so please look up the spreadsheet and try these settings on your radio. Remember you'll need to select each DSP setting (slow, med, fast, prog) for each receiver so your changes work with both.

The radio is fantastic, but it does take a few tweaks to make it 100%.

Just acquired an Orion II and no luck thus far getting the PC port communications to work. While there seems to be no mention of the serial port parameters in the manual, it appears that the speed should be 57.6 Kb, stop bits -1, no parity. Using a serial port here and all the same software and cables that have been used with a dozen other rigs over the past couple of years. The logging program is DXLab and Commander is properly configured for the Orion parameters. I don't see any Orion menu items that pertain to the serial port. Is there something I've missed that's parculiar to the Orion??

Don't need an education on serial ports, cables, software etc.

Thanks for any help.

Problem solved! It turns out there is much more info in the DXLabwiki than in the Orion manual. The problem was that RTS must be set to FLOW and was set to OFF.

Topic: 6855 Message: 6855

Just acquired an Orion 2 the other day and haven't had the chance to read every word in the manual yet, but have noticed one odd thing. Every now and then, when I power it on, I find that some menu parameters have been reset to the defaults. For example, the Internal Keyer is turned off, or the Sidetone Pitch is set to 700 Hz instead of the 590 I had it set to. Haven't been able to spot a pattern yet, but maybe something I'm doing is resetting these parameters? Paddle is always plugged into the front panel jack. Firmware level is 2.044A.

Floyd,

That definitely does not happen on my O2. I wonder if the internal battery may be low?

Hi Rod. Someone else mentioned that in a private email on the subject. Do you have any idea on how long the batteries last? I don't yet know just how old this unit is. I just thought it was odd that there were just a couple of parameters that were being reset (at least that's all I found) while almost everything else is still set to the values I specified. Guess I'll just watch things for a while and see what develops.

I had this happen once. I have owned my Orion II for over a year. Sometimes with computer processing something just doesn’t get written into memory correctly and this causes an error.

OK- just discovered what's resetting the parameters. I had installed the N4PY software and when that starts up the parameters are being reset. I'm sure it's setting some defaults that I've not yet set up in the N4PY software.

Thanks for the reply Gary
I really like the receiver, especially on small signal is more sensitive than my 756Pro in particular in the bands 80 and 160 the difference is more marked, but I do not like the NR , in position 1 is too strong and suppresses the small signals, in higher settings the signals over 9 become distorted.
I wanted to know if on older versions of the firmware had a lower NR.

Thank you for the advice on the use of this radio, a friend had warned me that this radio is "different" from the usual Japanese and need make use of the AGC and RFgain

6864. Orion 2 display - what's the letter in the box?

Yahoo group: orion565 (2009 — 2013)
Date: 2011-04-19 00:24:43 UTC

Just to the left of the TRS indicators above the decimal part of the frequency readout appears a blue letter in a box. It varies among A,B,C,D and I can't find the meaning. Nothing in the Operator's Manual that I've seen. Obviously something to do with parameters I've specified somewhere, but haven't seen the pattern yet. What is it?

That indicates which bandstacking register you're using on that band. Push the band button multiple times and you'll see it rotate through the four registers.

Hmmmmm... That's not the way mine works. They appear to be true bandstacking registers and multiple clicks on packet spots would overlay the previous frequencies, all within one bandstacking register. I've had other rigs with "quick memories" or similar name, where they can operate as you describe.

Looks right! I've just had the rig for a few days and haven't spent much time operating yet. Eventually, I'd have noticed that it was a bandstacking register indicator. Sure would have been a nice thing to put in the manual!

Yeah, I think the manual came out way before the indicators on the display. The Orion's always had the bandstacking registers, but it was a later release of the firmware that added the indicators in the display. I use the BSR's to get me to the portion of the band, and set the mode for (A) CW, (B) PSK, (C) RTTY, and (D) SSB. All the indicator did was force me to look at it each time - hi! Before the indicator I just looked at the display, hmm, 14070 and USB - that's the PSK setup - two more clicks and I'm at SSB! Now, when I jump on spots, I hit the band button first and cycle to the portion of the band I'm headed, then click the spot to have DX4WIN take me to the freq/mode. Otherwise, the last band segment I was on will get clobbered with the new data. Thought I'd let you know about that and save you discovering it for yourself later.....

As I recall there are 4 band stacking registers. They store the last set
of parameters after about 20 secs of no changes. If you make a change,
the timer starts all over. I think the # symbol appears when the data is
stored. By pressing the Band button one can step through the registers.

I see. I probably should have gone back and read the forums for the past few years to get an idea when various things were added. I do have the latest version of the manual, but it appears that is from October, 2006, so there may be many things missing. Now I wonder if there's some function there that's not in the manual but that would be useful to me. On the other hand I've read that there are other functions that have appeared and then been removed in subsequent versions of the firmware (fixed mode for the scope, for example).

I generally use bandstacking registers here in the same way that you do. They always end up screwed up for the same reason and I'm afraid I'd never remember to go to the right register before hitting the spot. I'd like to see a different implementation of the BSRs - maybe a single memory per band when pressing the band select buttons, but if you then hit mode button, the frequency that appeared would be the last frequency you used on that band in that mode. A bit cumbersome on the Orion since you have to hit a mode button and then select the mode with another button. Or, just add a CAT command that would allow the logging program to position the BSRs to the right one for the mode the spot is for.

The Orion 2 is the only rig I've had (of many) that give any sort of indicator indicating which BSR is active. I'll just have to pay attention to it.

A while back I had a similar discussion through email. Below an explanation which might help on the bandstacking.

Introduction;

In the early days with analog VFO's switching between bands changed the frequency but not the VFO setting. In other words, when working on 28.500 and switching to 80M just resulted in 3.500... It might be a poor example but that was the logic in early days.

With modern digital VFO's we have the possibility to store and recall frequency (and other elements) at any time we like. We could save a certain frequency into memory and recall it later. Same applies when we change bands... each time we change bands, we can recall the last active frequency for the band we are moving to. This allows us to escape from the analog VFO dependency... Besides user available memory locations to store and recall stuff, the orion also includes automatic memory locations which they call bandstacks.

Bandstacks summary:

1) Each band has four unique memory locations called bandstacks (which are selected automatically when pushing the same band button)

2) Within each band one can rotate through the four unique memory locations which executes the following steps:
a) Store current frequency and mode into current memory location
b) Recall next bandstack frequency and mode
c) Mark bandstack as active

3) Prior to switching band (move from 80M to 20M):
a) Store current frequency and mode into current bandstack memory location
b) Mark current bandstack memory location as active on 80M (provides the hint which bandstack should be recalled when returning to 80M)

4) After switching band:
a) Check which bandstack was marked as active for selected (20M) band
a) Recall bandstack frequency and mode

In more detail;

1) you might have noticed that switching bands also includes recalling previous frequency and mode?
2) If you are on 80M (3700, LSB) and switch to 20M and back again to 80M, your VFO and mode settings will be updated to 3700 and LSB automatically?
3) for each band the last active frequency and mode will be saved (when you push other band button) and recalled (when you push the associated band button)
4) above is the simplest form of bandstacking but the stack is just one memory location for each band....

Bandstacking is an extention of above logic. But now you can have this behavior within the same band using four bandstack memory locations. In the last firmware versions there is an indicator for the bandstack memory location (a,b,c,d) which is really nice. Without the indicator it becomes challenging to use bandstacking.

Introducing bandstacking;

5) within the same band (lets assume 80M) you have four bandstack memory locations. Each memory location will remember last active frequency and mode.
6) assume you are "working" while bandstack c is selected. Frequency is 3700 and mode is LSB.
7) now you push the 80M band button.... the following happens; 3700 / LSB is saved in bandstack c.... frequency and mode as previously saved in bandstack d will be recalled... perhaps it is 3575, CW. Give the VFO a swing and change it to 3580, CW
8) push 80M band button again, 3580, CW will be stored in bandstack d and bandstack a memory will be recalled.... if you continue you will arrive back in bandstack c which will recall 3700, LSB mode

In essence each time you push the -same- band button, you will save the current frequency and mode in current bandstack memory location and you will recall the frequency and mode from the next bandstack memory location...

Bandstacking and band switching;

9) each time you change bands the logic still stands. Prior to the band switch, frequency and mode will be saved in current bandstack memory location followed by switching to the other band.
10) when the other band becomes active the firmware will check which bandstack was active last time and recall that frequency and mode.
11) you could have bandstack c on 80M, while bandstack b is active for 20M... It is incorrect (as far as I know) that if you select bandstack a on 80M this automatically means bandstack a is active for all other bands... The bandstack location (a,b,c,d) should be decoupled between bands.

Hope this helps

Hi Onno. Actually, I have a complete and full understanding of everything having to do with bandstacking registers. I've designed and implemented digital VFOs with the capability. My only question was: What is the letter in the box next to the VFO frequency.

My eyes didn't catch the fact that the dim blue letter was changing when I hit a band button multiple times. And, the Orion II must be the only transceiver on the planet that assigns a designator to the bandstacking registers for display. Had I cycled through the registers while watching everything on the display carefully, I'd have noticed the letters changing, but at that point in my Orion experience, I hadn't done that yet. It would have helped if the manual, which I read cover to cover twice, had mentioned the letter designator, but it doesn't. Someone else explained to me that the designator was added sometime later in a firmware update.

Thanks for your help and maybe we'll meet on the air.

73, Floyd - K8AC

Floyd, the Ten Tec Omni 7 also displays A,B, C, D, for each of the four band stacking registers.

6875. Orion II - screen problem on startup

Yahoo group: orion565 (2009 — 2013)
Date: 2011-04-25 08:05:44 UTC
From: akipete
Topic: 6875 Message: 6875

Hi all,

I have an Orion II which recently developed a problem with the display. The display is completely white for about 4 or 5 minutes after turning on the radio, though in this period the radio sounds like it is doing all the right things....there is silence during the short boot-up process, and then the audio cuts in...if the last used frequency is active, the RX is clear. It is "just" (?) that the screen is white (makes the rig rather challenging to use).
After this "warm up" period, the display is completely normal, however this is only after power off/back on in the warm state.

I notice in this User Group messages (around message #5759) that a similar problem occurred with the Orion I. The suggestion for the Orion I was to replace the R702 potentiometer and the C900 capacitor on the A9 board. The member raising the issue received more than one response.

Has anybody had a similar experience with the Orion II, and if so, what was the cure? The same as above, or something else? Does anybody know if the fix for the Orion I would be the same as for the Orion II?

6876. Orion II heat sink temperature

Yahoo group: orion565 (2009 — 2013)

From: floydsense
Topic: 6876 Message: 6876

Does anyone have info on the Orion II heat sink design temperature? I'm looking for things like: normal operating temperature with transmitter not active, maximum operating temperature, etc. Need data for heat sink without the TenTec cooling fan installed.

After comparing setting with Daniel - V02FF I set my Orion II up with different settings and WOW what a diff

pulling out the really weak ones that can hear me but I had difficulty hearing them

Dramatic difference and I am working things on bands that I had given up on with weak signals and, QRN and QRM

Its like I got a new life in this rig

No thoughts of adding a new rig at least for the moment.

Mike,
go to Yahoo Groups for Orion565. Login to the group (your a member since
you use the list), and go to the files menu. Its at the bottom under my
name and its an Excel Spreadsheet. I've attached a copy to this email if
you can't find it.

I have sent back my answers to Gary and he will publish. One central point to get the info

think its better to let him show the spread sheet as I am not the author

my answers are incorporated in his detail sheet

I believe he will put on the Orion user group page

Mike(w8trn) if you need to contact me off line I am here

thanks guys

Mike,
go to Yahoo Groups for Orion565. Login to the group (your a member since
you use the list), and go to the files menu. Its at the bottom under my
name and its an Excel Spreadsheet. I've attached a copy to this email if
you can't find it.

6884. Orion II spectrum display problem

Yahoo group: orion565 (2009 — 2013)
Date: 2011-04-27 03:21:44 UTC
From: Tony Sokol
Topic: 6884 Message: 6884

Hi Gang,

I have been noticing that the spectrum display on my Orion II sometimes has very low sensitivity. At times a 30 over 9 signal barely shows a pip. Tonight with all of the QRN it was really noticeable when the noise would suddenly drop to almost nothing when the meter is showing a solid 25+ over 9 noise level. I seem to be able to get it back scrolling through the band stack registers for that band. This is an intermittent problem and the drop is sudden and then it pops up back to normal after a while. Before I call Ten Tec I need to ask if anyone else has had this happen? Am I missing something here?

Thanks
Tony - W9JXN

6885. RE: [orion565] Orion II spectrum display problem

Yahoo group: orion565 (2009 — 2013)

From: art davis
Topic: 6884 Message: 6885

I've noticed theh same thing here on a regular basis. Sometimes all I have to do is to key the TX with a tap of the key or change bands momentarily to "wake it up". It seems to not be related to the version of firmware installed.
Post if you find a cure.

Tony and Art,

What version of firmware are you using?
I'll see if I can recreate it at TenTec.

Note, in case you don't know, firmware version is seen when you turn on the 565. The latest version of the 566 is 2.044A. If you are not using that version, you are welcome to try it out and see if the problem remains.

Thanks,
John Henry

John,

My 566 is using 2.044A and so far I really like it. Sometimes
it will work fine for quite a while and then all of a sudden it drops
like a rock! Then it's on again off again for the duration. How about
yours Art?

Hi Tony,

FYI, I have never encountered that problem with my Orion II and I have been using 2.044A since it came out. The worst problem I have encountered is a couple bad caps on the Power Distribution board. I replaced them with high ESR caps. The only other thing was a dirty controller.

For me, this rig has for all intensive purposes been trouble free. I use it an average of maybe 10 to 15 hours per week.

6889. Non functioning S Meter

Yahoo group: orion565 (2009 — 2013)
Date: 2011-04-30 16:14:17 UTC
From: Ron Davies
Topic: 6889 Message: 6889

I finally got round to getting the Orion 565 modification done to support 2.x firmware and it is up and running O K except that the 'S' meter although illuminated is inoperative. I have checked that it is physically connected and I guess that the illumination would be off anyway otherwise as there are four leads into the meter.I know that the meter is software driven in Version 2.064 x11 of the software and guess that there must be some setting I am missing. Any suggestions gratefully received.

From: Barry N1EU
Topic: 6892 Message: 6892

The spreadsheet uploaded contains TX settings for two users. Both these users have CW Rise/Fall set for 5msec. This setting will result in transmit key clicks. This topic has been discussed extensively on the main Ten-Tec reflector (e.g., see thread starting at http://lists.contesting.com/_tentec/2007-03/msg00211.html). The actual rise time is about half of the value indicated in the menu. Please don't copy this spreadsheet setting of 5msec - instead, use 8msec.

From: floydsense
Topic: 6892 Message: 6893

Barry - I'm a recent newcomer to the Orion and hadn't yet run across W4ZV's comment on the rise time settings. I was curious as to whether any improvement had been made in the Orion II in the four years since those comments.

So, I recorded the Orion II's CW waveform and observed the actual rise time at various settings of the Orion's "CW Rise/Fall" menu parameter. I found that the actual rise time maps very closely to the menu setting. I don't know what the accepted definition of rise time is today, but I recall seeing one definition that explained it as the time it took the waveform to reach something like 66% of the maximum value. I found the Orion II settings to reflect the time it takes to reach about 100% of the maximum value, so depending on the definition used, the settings today are either accurate or just a bit short. Certainly, not 50% off.

In listening to the keying sidebands on a separate receiver, they clearly pick up with shorter settings of the rise/fall time, and clicks are not detectable at the 10 ms setting. I don't recall ever seeing a quantified level of acceptable clicks, but my Orion II at anything over 5 ms sounds pretty good.

Recently I spent a few days with an FTDX-5000 and recorded the CW waveforms for both QSK and non-QSK modes. They were the worst I'd seen (even in non-QSK mode) and the menu rise time adjustment on that rig had zero affect on the rise time, although at the minimum 1 ms setting the front of the waveform was much more rounded than at the longest setting! Needless to say, at least the unit I had was true to the Yaesu click-generating tradition.

I wonder if anyone knows for sure that Tec Tec improved the rise/time setting performance in firmware over the past 4 years?

Barry,
as the owner of the spreadsheet, would you mind sending me your settings?
I'd be glad to put them on the spreadsheet for others to try. I've never
had any reports that I had key clicks, but after your advice I changed mine
to 8msec this morning.

To the best of my knowledge, and I've been involved with v1 and v2 beta testing, no changes have been made to cw waveform shaping. Several of us also encouraged Ten-Tec to change the default setting upward from 5msec. The easy fix is to just adjust the setting to 8msec. That sure beats other radios that require an actual hardware change to improve their bad keyclicks.

The value of 7-8msec minimum setting for rise time was found mainly be a lot of observations on loud 160M signals. Many of the big topband dx'ers 5 years ago were using Orions and the difference between 5msec and 8msec setting was clearly heard. It was also observed that there was no deterious effects on the readability of your 8msec signals by remote dx stations.

6896. Some additional photos for VE7TK Orion IF tap modification

Yahoo group: orion565 (2009 — 2013)
Date: 2011-05-01 17:31:04 UTC
From: floydsense
Topic: 6896 Message: 6896

I added a couple of photos to the photo page relating to installation of the Z10000U buffer amp in my Orion II. VE7TK talks about where to obtain the 12 VDC for the buffer, but didn't show a photo. The amp as received from Jack Smith included a 6" length of red wire for the buffer power, but of course that was far too short to reach the plug strip, adding to my confusion. One of the photos shows the connection I made to the strip.

The other photo shows how I terminated the end of the coax run to the Spare jack on the Orion II rear panel. You can solder the coax to the rear of the board as VE7TK showed, or you can find one of the little coax plugs and just plug into the empty connector as I did in the photo. This type of connector is used internally in Kenwoods, Icoms and Yaesus and you might be able to obtain a couple of the plugs from one of those sources.

6898. Re: Non functioning S Meter

Yahoo group: orion565 (2009 — 2013)
Date: 2011-05-02 10:56:24 UTC
From: pa1ap
Topic: 6889 Message: 6898

To my knowledge the S-meter is driven by 8 bit DAC and although firmware could drive the DAC differently I have not seen the S-meter being inoperative.

I can only suggest to check the following;

1) perform mem clear and master reset

2) check if the s-meter is broken using multimeter (murphies law)

3) connect a computer to serial port and read out the s-meter values. Those values should deviate with the signal strength. Serial command ?S

4) the V2 hw modification -> does the menu confirm V2 mod is performed? Press menu for 10 seconds or so and you will see a message. This does not confirm everything went well, but provides first check. Perhaps check if you did not cross a soldering somewhere near the V2 mod....

Hope this helps,

Best regards, Onno

>
> I finally got round to getting the Orion 565 modification done to support 2.x firmware and it is up and running O K except that the 'S' meter although illuminated is inoperative. I have checked that it is physically connected and I guess that the illumination would be off anyway otherwise as there are four leads into the meter.I know that the meter is software driven in Version 2.064 x11 of the software and guess that there must be some setting I am missing. Any suggestions gratefully received.

6901. noise reduction and signal enhancement

Yahoo group: orion565 (2009 — 2013)

From: k0xb3
Topic: 6901 Message: 6901

This may be known to others, but I don't think I've seen it described before. In any case, here's what seems to be an effective technique for pulling signals out of noise. I'm using firmware version 2.044A.

I've used NR with mixed results in the past. Sometimes it worked great, and other times it didn't seem to help at all. But the other day, I noticed if I adjust the RFGAIN control at the same time I have NR turned on, there is often a "sweet spot" where a signal I could hardly read pops out of the noise and becomes easliy readable. My experience is mosty on CW, but this seems to help with SSB too.

Hi Gang.
I have for sale one of my new ELITE series dust covers. This was used as a demo model, but you can not tell it from new. Price is $55.00 shipped in the CONUS. Shipping anywhere else in the world is $14.00.

PLEASE DO NOT RESPOND HERE ON THE GROUP

Contact me directly at: stan "AT" radiodustcovers.com or via my website: www.radiodustcovers.com

You can see a picture of the cover style in the PHOTOS section.

Take care,Stan W6ON

In most cases with DSP based radios one should optimize the system by adjusting the RF Gain according to band conditions and antenna system. Rarely is it necessary or is it even suggested to run the RF Gain at maximum. In other words, back the RF Gain waaaayyyy down to find that weak signals will simply pop out of the noise.

6906. MOD'd orion SPARE RCA for antenna output for SDR-IQ

Yahoo group: orion565 (2009 — 2013)
Date: 2011-05-14 16:05:57 UTC
From: saukp
Topic: 6906 Message: 6906

i have uploaded a pdf file which shows my mod to the orion to use the SPARE RCA connector on the rear as antenna output

file name is orion_mod_spare.pdf

this is a simple plug-n-play mod..NO SOLDERING required

i did this mod to enable the SDR-IQ to use the same antenna as the orion's sub receiver

cost was $45 for custom cables by RFconnectors
and
$30 for the rfsplitter(1-100mhz) off ebay

now have a reatime panadapter
and
three receiver capability
and
more receiver capability when sdr-radio s/w gets updated

multi-receivers to help sort out the pileup when trying to figure out
where a dx station is listening

enjoy

be glad to answer any questions

Paul K3SF

Topic: 6906 Message: 6907

I'd be interested in hearing how you think the SDR-IQ performs on 12 and 10 meters. I have used a similar setup with my FT-1000MP Mark V, feeding the SDR-IQ through a splitter. When 12 and 10M opened up a bit, I noticed that weak signals that could be heard clearly on the Mark V were not visible on SpectraVue. That was not the case on the lower bands where weak signals could easily be seen when just barely audible. I shipped the SDR-IQ back to RFSPACE for examination and their conclusion was that the SDR-IQ was performing properly.

This is of course a non-issue if one doesn't spend time looking for the very weak stuff. I'm going to try an SDR-IQ again now that I have the Orion II and installed the buffered IF tap, also routed to the spare connector on the rear panel. At the IF frequency of 9 MHz, the SDR-IQ sensitivity was great. I have no idea whether all SDR-IQs lack sensitivity on 12 and 10 meters.

hi floyd

have not tried the sdr-iq on 12 n 10 m yet..

mostly 20 and 17 m..seems pretty good there
have not tried weak signal hunting yet..mostly using it to sort thru dx pileups..

i did not bring the 9mhz if out but tapped into the antenna system
for the sub receiver...i still need to get rs-232 cable to go from the sdr-iq to the orion to get them to track automagically..

when i get more operating time will see how the sdr-iw does weak signal wise..and let you know

still kinda new to sdr arena only had the sdr-iq since christmas
and as usual works seems to get in the way of hamming ;-))

i am able to run the sdr-iq natively on my iMac and in vmware fusion as a virtual PC running XP... i use cutesdr in the mac environment
and both sdr-radio and spectravue in the virtual pc environment.

so as you can see i am still in the experimental mode

6909. Re: MOD'd orion SPARE RCA for antenna output for SDR-IQ

Yahoo group: orion565 (2009 — 2013)
Date: 2011-05-14 17:09:59 UTC
From: floydsense
Topic: 6906 Message: 6909

There's another option for "slaving" the SDR-IQ to the Orion from the standpoint of frequency control, but it won't be attractive to everyone. I use DXLab for logging, DX spotting, etc. and it includes a "secondary CAT" capability. So, you'd connect the Orion on one of the CAT ports and the SDR-IQ to the other. Then in DXLab (the Commander module does the rig control), you can set an option to cause frequency changes from either rig to be sent to the other. So, tuning the Orion would result in the SDR-IQ following and mousing on a signal in SpectraVue would result in the Orion being set to that frequency.

At this point, I haven't used this capability myself with the Orion II and SDR-IQ, but will implement that in the next couple of weeks. I have used it with an FT-1000MP Mark V and Icom 756 Pro III and it worked flawlessly. A bit weird to tune the Icom and watch the Yaesu follow, and vice versa. And when you mouse on a DX spot, both rigs are set to the spot frequency.

The only downside is that the DXLab suite in its entirety is complex and takes some time to learn. The upside - it's FREE, and things work as advertised. The documentation is superb, and the author responds to problems very quickly via the Yahoo Group.

hi

some people have tied directly into the sub receiver or even the main receiver antenna connection...i would not recommend this approach

the reason i chose the subreceiver was to minimize impact on the main receiver when i want max receive signal to main receiver..simply by switching the sub receiver off the main receiver antenna

also
i used an rfsplitter just like there is a rfsplitter built in to the orion when the main and sub receiver are selected to be on the same antenna. This provides appropriate electrical isolation.

by the way, the rca jack is easily accessible via the tmp connector in the I/O board..no soldering need just right cable to plug into the tmp connector..this connection is shown on the circuit diagram for the i/o board..

Hi All,

I use my OII mainly in SSB and now I intend to be more QRV in RTTY.
Actually the OII is equipped with a 1.8 kHz filter.
Which additional filter should I buy , 600Hz or 300Hz ?
All comments are welcome

Depending on the kind of operating you plan to do on RTTY (contesting, DXing, etc.) you may just want to wait and see how it works out just using the DSP and setting the bandwidth to around 500 Hz or so.

I agree. I have other filters in my OII, but I think you'll find that DSP in the rig will work very well for rtty.

OTOH, the OII is dramatically improved by the addition of the roofing filters. If you do put one in, the 600Hz (2001) roofing filter is what I'd recommend as a first choice.

Using AFSK 45.45 baud RTTY in USB on the Orion (I) I find 300 to 320 Hz to be a minimum BW, therefore I'd suggest a 600 Hz filter. That filter will also accommodate 75 baud BW (about 450 Hz) if you operate that speed. I've found that the 500 Hz roofing filter with 300 Hz BW setting offers plenty of selectivity for contesting.

For 17 meters, use 15 meters. For 12 meters use 10 meters. Tentec provides a plug in mod for 17 meters (If I remember correctly).

Cant' help you with 30 meters.

I need almost 85 watts of drive on 17 and 12 meters to get about 750 watts out of the Centurion.

Hello

I have a TT Centurion. I put up a 17 meter antenna but the band switch does not have that band listed, no 30 or 24 either. I see nothing in the manual. I purchased the Centurion in 2002 or 2003 so it should work the WARC bands. Anyone out there who can enlighten me..
Thanks Tim

Yep, for the 18 MHz band put the bandswitch on 15 meter position. Typical values for a 50 ohm load are 8 for the LOAD control and 2 for the TUNE control. For the 24 MHz band, put the bandswitch on 10 meters. Typical values are about 5 fror LOAD and 2 for TUNE.

For 30 meters, well we are limited to 200 watts PEP so I guess I don't understand the need for the amp. But if you insist, set the bandswitch on 20 meters an typical values for LOAD are 9 and for TUNE would be 3.

Be sure the amp has the 10 meter kit installed as these were optional upon proof of a valid ham license in the USA. Otherwise it won't tune 12 meters or 10 meters. For 10 meters the LOAD value is 4 and the TUNE value is 1.

See the tuning chart in the manual on page 2-7, Figure 2-4

The amp typically has some 10 dB to 12 dB of gain. Thus 75 watts of drive should produce about 750 to 850 watts output. Higher frequency bands are typically somewhat less gain. On 10M with 85 watts of drive, I measure about 900 watts output. This says the amp is contributing about 815 watts of power with the other 85 watts being from the exciter. This is about 10.2 dB of gain in the amp. On 75M I measure the gain about 12.2 dB thus 90 watts of drive produces about 1500 watts output with the amp contributing some 1410 watts of power.

My bad! I mis-stated the gain figures in the earlier post as I did not remove the drive power from the total output power.

10 meters has about 9.8 dB of gain
75 meters has about 11.9 dB of gain.

Honestly, I can not remember the function of the mod. It is quite simple, fits on a 2 x 4" board. I believe it improves drive between the transceiver and the amp when operating on 17 meters.

I suggest you give Ten Tec a call for the function of the modification.

That might be the case Bob with the Centurion. I know I am using an Ameritron AL-82 which also uses a pair of 3-500Zs also. The input impedance is close to 50¦¸ even for a pair of untuned input 3-500Zs. I used to have an SB-220 and used it without mods for 17 and 12 meters. Drive requirements are close to the same no matter whether on 15 or 17 meters. If I remember correctly, it took a little more drive for full output on 12 and 10 meters.

What I did was tune the input on my AL-82 to a point where it provides close to the same input SWR to my Orion II for both 17 and 15 meters as well as 12 and 10 meters. That input SWR is ¡Ö1.3:1 the Orion II sees on 17 thru 10 meters.

The Model 422-10 Ten Meter Option board kit is designed to enable operation of the Centurion on the 10 meter band. In addition, a new 15 meter low pass filter circuit will provide improved performance on 15M.

Here is the summarized procedure:
****
Originally installed is the #81550 15 M Input Filter Board. This is accessed by removing the top cover and sliding it towards the rear about 1/4" and then lifting upwards. This is a small rectangular plug in circuit board installed on the larger #81539 Input Low Pass Filter board. Remove the #81550. Install the new #81546 15/10M Input Filter board aligning it with the silkscreen outline on the #81539 board. Make sure the 8 pins align correctly and gently press the new board into place.

Place the Band switch in the 160M position and locate the Band switch stop screw and collar. Loosen this screw and slide the collar toward the front panel so that the screw will clear the switch stop pin. Tighten the screw.

Make sure the Band switch will now rotate to the 10M position.
****

I suggest you contact Tentec Service in the event your amp does not have the 15/10M option board. The complete kit and installation instructions and other information is available upon proof of being a current licensed ham.

Hi Wes,

Well, there was at least one new product that has a lot of people excited. Elecraft announced the KX3, which is an ultra portable blending of the K3 and the KX1 (well, sorta'). Here's a link to the ARCI website where you can see a video demo of the new rig.

http://www.qrparci.org/content/blogcategory/1/118/

There is also a lot of discussion/speculation going on about the KX3. Best places to follow it are the Elecraft reflector and the QRP-L reflector. This rig may not raise the pulse rate for a lot of Ten-Tec owners, but it's pretty exciting for folks who are into QRP stuff. Also, there are planned accessories that give it 100 watt capability (an outboard amp module mainly). However, I suspect it will be at least 6 months before we see these in production.

Is no news good news?

Or maybe everyone is so involved in all the good stuff that they just haven't started commenting yet.

I've seen basically no news on anything from Dayton. Any revolations? Anything really new? Even the Kenwood, Elecraft, ICOM and Yaesu reflectors have been amazingly quiet.

6934. Update on FLRIG CAT Application

Yahoo group: orion565 (2009 — 2013)
Date: 2011-05-25 11:42:38 UTC
From: Bob McGraw - K4TAX
Topic: 6934 Message: 6934

As posted on the 599 Eagle reflector.
73
Bob, K4TAX

I would like to congratulate Ten-Tec on being singularly responsive to the handful of systems analysts who create amateur software. I've corresponded with you in the past and you have always been very helpful in answering my questions.

I am in the final testing phase for the next version of the program flrig, a cross platform transceiver CAT application. It supports the Argo-V, Pegasus, Jupiter and Eagle with what I think is 100% of the control and monitoring functions for each radio. I am working on a few quirks with the TT588, but am sure those will resolve themselves. I must rely on my test users as I personally do not own every radio, just an Argonaut V, Pegasus and Jupiter.

Flrig supports 45 different transceivers from 7 different manufacturers. The Ten-Tec programmer guides stand head and shoulders above all the rest. The Pegasus is probably the 2nd most difficult transceiver for which to create interface code. The most difficult is the Kachina-505DSP, primarily because that one required reverse engineering to discover the correct response streams to various commands. That said, I must go on record to say that the Pegasus programmer guide is far superior to any other manufacturer's manuals. The command codes / responses are well documented and the actual transceiver data streams are fully in accord with the manual specifications.

Flrig runs on all Windows (post Win98), Linux, Free BSD, OS X, and several minimal footprint OS such as Puppy-Linux. I will email you when the new version has been published for public download. Flrig is open source software and always free.

Thanks for making my avocation a pleasure.

6935. Thermostatic control for the Orion II cooling fan

Yahoo group: orion565 (2009 — 2013)
Date: 2011-06-02 12:55:00 UTC
From: floydsense
Topic: 6935 Message: 6935

I just recently acquired my Orion II and was surprised that the optional cooling fan that was installed ran all the time. My other transceivers going back 20 years all had thermostatic fan control so you didn't have to listen to the fan running if you're just listening to the receiver.

While combing through the Far Circuits stuff at Dayton, I picked up one of their little circuit boards for building a thermostatic fan controller. The circuit is from an article in June 1994 QST by Bertram Kolts, WA0WZI, titled: "An Automatic Temperature-Controlled Fan" and I've used it a few times in the past, usually building it on a small piece of perf board.

This provides a no-holes, plug-in mod that I used to prevent the Orion fan from running unless the heat sink reaches the adjustable turn-on temperature. I secured the board to the side of the fan housing with velcro, and the fan gets its power from the board which gets its power from the 13.8V jack you'd plug the fan into normally. The only other item to mount is the thermistor, which you can glue into a 1/2" long, 1/4" diameter piece of metal tubing, which is then force-fit between the two top fins on the heat sink. The Orion fan mounting bracket is such that air is not drawn between those two fins, so the thermistor will not be cooled directly by the fan's air flow.

The circuit includes a temperature set mini-pot on the board and I set it so that the fan is off after the Orion has been powered on for several hours. With that setting, the fan came on a couple of times during operation in the CQ WPX CW contest. It would be easy to adjust the pot so that the fan comes on only when operating the digital modes for extended periods.

Total cost would be in the area of $15 even buying everything new. The mod can be easily removed, leaving no trace.

6937. Orion II and Transverters - questions

Yahoo group: orion565 (2009 — 2013)
Date: 2011-06-02 17:32:25 UTC
From: floydsense
Topic: 6937 Message: 6937

Thought I'd try this question here as I got nowhere on the Ten Tec reflector. I have an Orion II and currently used my old Yaesu FT-1000MP Mk V with the FTV-1000 transverter on 6M. I'd really like to use the FTV-1000 with the Orion II, and have read the Orion manual, but that didn't provide the answers.

The FTV-1000 would be driven from the Orion's rear panel XVRT RF jack. In the Orion TX menu, there's a Transverter item and the manual says that when it's ON, there's no RF output from the ANT1 or ANT2 connector. There's also a menu item Transmitter with ON and OFF options. It appears that I don't have to turn the Transmitter item to OFF to use the transverter if Transverter is turned ON - right?

The Orion manual also says the receive signal from the transverter is fed to the AUX RX jack. Can I use the ANT1 connector for the receive signal or does setting the Transverter item to ON disable that path for receive as well as transmit?

Floyd -

I don't have a transverter for my Orion 565, but have some suggestions.

Turn on transverter and leave transmitter setting ON. Run a cable from the rear panel XVRT jack to a wattmeter and then to a dummy load. Transmit and see if you get any output on the wattmeter.

If you have a noise generator, with transverter on and the noise generator hooked to ANT 1 or ANT 2, see if you can hear the noise on the receiver. Then try it on the AUX RX jack.

This transverter is a different animal from the Ten Tec. The drive for full 200W output is only 50 mV or -13 dBm. That's why the drive must come from the XVRT RF jack, which has an output range of 5 to 15 dBm.

I wanted to get an answer on how it really functioned before experimenting with it. The transverter requires less than 1 milliwatt to drive it to full output, so not likely to show up on most wattmeters, but I see that my LP-100 has a dBm scale in that range.

With the Orion tuned to 40M, I switched the Transverter parameter to ON and that does kill the output from the ANT1 jack, but ANT1 still functions fine for receive. So, apparently there's no real need to use the AUX RX jack when receiving with the transverter. I suppose the manual writer assumed that you'd want to leave your HF antenna connected to ANT1, but this transverter has the T/R switching built in and the station beam covers 6M anyway so the ANT1 connection is preferable.

By using the AUX RX jack you won't accidentally transmit into your transverter thus causing ultimate and instant failure.

Us the Transverter Output on the Orion II nd the AUX RX and things will be just fine. You may need to include a switching line from the transceiver to the transverter to handle change over from RX to TX.

Hi,
i'm looking for transverter also (HA1YA)
and have a good price but can the orion
read the correct frequency on display ?
Can we configure the orion display for read 50110.00
and not 28110.00 like ts-850 kenwood or other radio ?Thanks

It's not inconceivable that such an accident could occur - it would require that the T/R line from the Orion to the transverter become disconnected and that the Transverter setting in the TX menu not be set to ON. Setting it to ON disables output to the ANT1 and ANT2 connectors. When used with the Mark V, the transverter gets a low level drive signal from the Mark V via a separate cable, but the receive signal is routed on the normal coax run to the Mark V. I'll bet there is some sort of protection on that line in the event the user forgets to disable the Mark V PA stage, but don't know since I've never been able to find a schematic of the FTV-1000.

I'm using the AUX RX jack because it simplifies my switching setup. I was a bit surprised to see that the Orion II has no input for external ALC, which this transverter supplies to the transceiver. Anyway, everything is working smoothly now and I have 195 watts out on 6M. And, I can see the beacons that can be heard today on SpectraVue. Mousing on a signal sets the Orion to that frequency. If only the Orion had some way of displaying 50 in place of 28 on the frequency readout as the Mark V has.

I couldn't find any evidence on the Web of anyone using this combination before, so I'll write up the details and post it to the Files section here.

I'm told that the N4PY software can accomplish that, but have not tried it since I don't drive the Orion with N4PY. I use the DXLab suite for logging/spotting and that does have the ability to show the correct frequency on the Commander frequency display. If you mouse on a spot that says 50.110, the Commander display says 50.110, but Commander sets the Orion to 28.110.

It certainly would be nice if the Orion menus had an option to show the transverter frequency as you say other rigs do. My Mark V works that way as well.

Topic: 6937 Message: 6948

I've used all sorts and brands of radios with transverters since about 1965 when I built my own transverter for bands 144 MHz, 432 MHz and 1296 MHz. Guess I don't understand the issue. Are we getting mentally lazy?

Of course with most any transverter, one will likely have to compensate the frequency from a few Hz to a couple of KHz due to the oscillator error in up and down conversions. Other than the correction factor available via N4PY software, some form of offset will likely be necessary.

At present all three of my commercial transverters do require mental adjustment of the actual frequency anywhere from -300 Hz to +750 Hz depending on which one/band I'm using. I've tweaked the oscillator for best accuracy after warm-up even though they are TCXO devices.

Transverters in conjunction with a high quality HF transceiver have the ability to produce outstanding results on the bands.

As to the Orion or Orion II, it will display the IF frequency on the 28 MHz band.

I guess I'm at odds with many folks on these items.

ALC - since the radios we use today do have excellent ALC systems as well as a precise power control system, I find that power amps or transverters {and I have both} do not need ALC detection. Just set the power on the radio for the correct drive value for the devices following and leave it at that. The ALC in the radio is much more likely to have better detection and have better attack and release characteristics than those in any amp. Just remember the strongest point in a chain is its weakest link. A poor ALC detection system in a amp will likely leave one with less than a desireable sounding signal on the bands.

AUX RX input - Yes forgetting to set the transverter option to ON in the radio will most likely send the next burst of energy from ANT 1 or ANT 2 direct into the 28 MHz output of the transverter. I doubt that the transverter IF output coil or mixer will deal with that very kindly.

I run three transverters on my Omni VII, being 144 MHz, 432 MHz and 1296 MHz. Legal limit amps follow the transverters on 2 of the bands and mast mounted preamp are ahead of all three the transverters. TX/RX switching gets very precarious.

Since all three transverters have slight errors of different amounts in their master oscillator frequency, mental frequency adjustment is necessary. I don't mind the 28.200.280 on the display is the real number for 144.200.00 MHz and such.

Subject: [orion565] Re: Orion II and Transverters - questions

It's not inconceivable that such an accident could occur - it would require that the T/R line from the Orion to the transverter become disconnected and that the Transverter setting in the TX menu not be set to ON. Setting it to ON disables output to the ANT1 and ANT2 connectors. When used with the Mark V, the transverter gets a low level drive signal from the Mark V via a separate cable, but the receive signal is routed on the normal coax run to the Mark V. I'll bet there is some sort of protection on that line in the event the user forgets to disable the Mark V PA stage, but don't know since I've never been able to find a schematic of the FTV-1000.

I'm using the AUX RX jack because it simplifies my switching setup. I was a bit surprised to see that the Orion II has no input for external ALC, which this transverter supplies to the transceiver. Anyway, everything is working smoothly now and I have 195 watts out on 6M. And, I can see the beacons that can be heard today on SpectraVue. Mousing on a signal sets the Orion to that frequency. If only the Orion had some way of displaying 50 in place of 28 on the frequency readout as the Mark V has.

I couldn't find any evidence on the Web of anyone using this combination before, so I'll write up the details and post it to the Files section here.

> I wanted to get an answer on how it really functioned before experimenting with it. The transverter requires less than 1 milliwatt to drive it to full output, so not likely to show up on most wattmeters, but I see that my LP-100 has a dBm scale in that range.
>
> With the Orion tuned to 40M, I switched the Transverter parameter to ON and that does kill the output from the ANT1 jack, but ANT1 still functions fine for receive. So, apparently there's no real need to use the AUX RX jack when receiving with the transverter. I suppose the manual writer assumed that you'd want to leave your HF antenna connected to ANT1, but this transverter has the T/R switching built in and the station beam covers 6M anyway so the ANT1 connection is preferable.

I don't think it's a case of people getting lazy. Things are much more complicated today - many of us have a lot of software integrated into the operation and they'd like to be sure that the frequencies get passed from one point to another without getting confused as to band. For example, I work someone on 6M on my Orion/transverter setup and if I'm not careful, it gets logged by the software as a 28 MHz QSO. At least in DXLab, I can tell the software it's a transverter and what the offset is from 28 MHz, so the frequencies get logged properly. It really doesn't bother me that the frequency read out on the Orion is 28 MHz, as there's no chance of my getting that mixed up.

But, since many of the Japanese transceivers manufactured before and after the Orion II have the capability to show the right frequency, one has to wonder why Ten Tec would go to the trouble to put the transverter features in that they did, and then not handle the frequency issue. If it was an oversight, that's one thing, but if it were because of some philosophical viewpoint on how things ought to be, they they missed the boat.

Anyway, not a big deal since the software is smart enough to handle it.

Again, since the transverter oscillator is not clocked by the transceiver system, the transceiver has no idea where/what frequency the station is operating. Even those Japanese transceivers that show the correct band, i.e. 50 MHz, 144 MHz and such are "assuming" the transverter is dead nuts on frequency. Which of course we know likely it is not.

Agreed, no big deal but it is more complex than a frequency read out.

You're right of course. I haven't lugged the HP generator into the shack from the workshop yet to check out the error, but I already knew it was pretty close. I've checked it against a local 6M beacon and I have no idea how accurate the beacon frequency is, but the Orion reads 350 Hz below the claimed beacon frequency. I ran across one other post elsewhere where a fellow said that his was 300 Hz off in the same direction. Considering the total lack of any sort of frequency synchronization, I guess that isn't so bad.

One could make clever use of the RIT and XIT settings to make the Orion's frequency read out (seemingly) correspond with the transverter in/out frequency.

6958. Handy bandscope / s-meter trick with 2064x11

Yahoo group: orion565 (2009 — 2013)
Date: 2011-06-05 14:18:54 UTC
From: pa1ap
Topic: 6958 Message: 6958

Greetings,

In previous firmware the bandscope and s-meter followed the VFO dial without interruption. With the new firmware both bandscope and s-meter stalls when dialing over the band.

There is a work around which provides "old behavior" with the new firmware;

1) move the main VFO to B (push A/B for couple of seconds)
2) move RX / TX to VFO B
3) done

If you change frequency and turn VFO B you will notice both bandscope and s-meter to move with you without stalling.

Hope this is useful for others. Best regards, Onno

Hi Onno,
I just check this on my Orion I and is working fine. Only the question is why on VFOA is not working this way?Maybe John Henry from Ten Tec can explain us whay is like that?Maybe we need new firmware?Any news about new firmware for Orion I?

Thanks
Arek AC2FC

Subject: [orion565] Handy bandscope / s-meter trick with 2064x11

Greetings,

In previous firmware the bandscope and s-meter followed the VFO dial without interruption. With the new firmware both bandscope and s-meter stalls when dialing over the band.

There is a work around which provides "old behavior" with the new firmware;

1) move the main VFO to B (push A/B for couple of seconds)
2) move RX / TX to VFO B
3) done

If you change frequency and turn VFO B you will notice both bandscope and s-meter to move with you without stalling.

Hope this is useful for others. Best regards, Onno

Hello O2ers,

It has been about a year since the changes have been introduced in the 2.044a firmware.

I would like to poll our group for which of the two non beta firmwares they prefer. I also would like to know also why you prefer the version you have decided to remain with.

Thank you for your participation.

Mike, thank you for the inquiry. I have recently obtained the O2 and am not sufficiently informed to comment. I like the rig and cannot comment either way about the software version.

It's not a kit. Far Circuits has the board available, but you'll have to come up with the parts yourself. A copy of the QST article comes with the board from FAR, or you can get a copy of the article from ARRL if you're a member. Here's a link to Far Circuits: www.farcircuits.net/ . The best thing to do is go to the bottom of that page and use the link to download their catalog in PDF form, then search for "Fan". It's not much of a catalog - just a list of boards available.

OK - thanks. I've looked that over carefully and find it rather confusing. Ordinarily, one would expect subsequent versions of software to include features of previous versions, but that doesn't appear to be the case with the Orion II code. For example, 2.041 mentions an enlarged sweep display and a "tuning cursor", neither of which appear to be in 2.044. If I were to download 2.039 or 2.041 to replace my current 2.044, would any of my current functions disappear or have problems?

Yes, both were removed from the previous version due
to challenges. Ditto for the 'waterfall' option.

In other words, 2.044 added some new things and also
removed some things not quite ready for prime time.

6969. PSK-31 Settings for the Orion (1)

Yahoo group: orion565 (2009 — 2013)
Date: 2011-06-21 03:52:06 UTC
From: Jim Koshmider
Topic: 6969 Message: 6969

Greetings to all -

I would sure appreciate some help in solving the following problem:

I am trying PSK-31 for the first time today - using the TT "Sound Card Interface Cable" and using the fldigi software.

I can receive OK (although I wonder if I have the optimum settings for receive).

When I try calling CQ, or try to respond to anopther station calling CQ, I don't see any indication of power out from my Orion. When I click on CQ, the fldigi screen shows "CQ CQ CQ de K8OZ K8OZ K8OZ" and then it repeats the same message, ending with "...pse k" (if I remember correctly). The receiver goes mute, but I don't see any indication of power out on the Orion's meter, nor on an in-line power output meter.

I have the power level set at 30 Watts, the VOX set to ON, the MODE set to USB, the Speech Processor OFF, the BW set at 2000, and I have tried varying the Mic Gain while calling CQ, but still nothing showing as output.

Thanks for any help with finding the missing link(s).

73,

Jim, K8OZ

Topic: 6969 Message: 6971

You will need to select the AUX Input or Line input as the audio source. The 712 interface plugs into the AUX input. The mike gain has no effect. Set the radio PWR to 100 watts and tune the radio as normal for 100 watts output. Adjust the LINE Gain on the radio for about 30% to 50%. Adjust the software transmit audio level for about 30 watts output as indicated on the radio or external power meter. The VOX should be off as the 712 handles the PTT switching.

I strongly suggest that you do not use BOTH as a selection. During transmit the MIC will be active and noise within the room will be transmitted along with the PSK signal. Not good & not legal.

OK on NOT using BOTH. I don't have the mike plugged into my Orion and mainly operate CW so that may be the reason I have not had any issues with using the BOTH selection. Good point, TNX Bob.

Grant,
I had the same problem with my Orion II when I tried to use my Windows 7 64 bit to load the software. It basically left the radio in an unknown state. I did a master reset and re-loaded the software using an XP machine and all is fine. My understanding is you can also use the Eagle's loader but point to the Orion file. The Eagle's loader works fine with Win 7 64 bit (see a previous Ten Tec post). This doesn't happen on all Windows 7 machines, just some but Ten Tec did isolate the problem.

In addition, if you happen to be running Windows 7, the ftdi usb/rs232 adapters work great while I could never get the prolific to work.

There is a history of issues with capacitors on the power distribution board. Likely the boot process starts with the microprocessor running before power is stable thus data is corrupt or not loaded correctly.

Also there may be a RAM battery issue. Worth a call and speak with Paul at Tentec.

Subject: [orion565] Orion I won't boot - only boots after master reset??

I have an Orion I with latest software installed and lately when I power up it starts as normal but never fully boots, display shows nothing and the analog meter does not light up. The only cure is a master reset. I hate to have to reset every time so do any users have any suggestions for the cause or a cure?

73 & good DX to you,

Hi Gang,
I am curious if anyone has tried the New Heil GM-5 Elite microphone with the HC-5.1 cartridge in it. I picked one up at Dayton and got a real surprise when I hooked it up to my Orion II and Omni VII. The drive level is waaaaaay down compared to the old HC-5 cartridge and the TT 709. I have everything cranked way up including the hardware gain, processor, and mic gain just to be able to get it to drive the Orion's ALC light. (I need a lot of audio to get the max 85 watts output from the Orion.) It's usable but darn! Anyone have any similar experience. The new Elite case in nice with the flat black finish and bright gold screen. Oh, and I did send it to the factory to make sure that I didn't get a bad one and they returned it with no comment except "warranty replacement". it is the same as the one I sent in, low output.

Hi,

Using ORION-1 I found the following in the past;

1- I did not receive official confirmation on my findings but I believe the TX equalizer is excluded from the ALC routine. In other words; the ALC is frequency independent.

2- Microphones with flat response combined with voice characteristics determine how ALC will respond. The frequencies with highest amplitude will drive ALC. A studio mic is not suitable for most SSB communication unless you start messing around with audio equalizers / processors which makes the whole excercise over the top IMHO unless you aim for Barry White or Lady Gaga kind of communication...

3- In my case the studio mic was flat from about 75Hz and apparently while talking some of the low frequencies triggered ALC at weird moments. At first I thought RFI was getting into my audio chain but only after including a high pass filter (200Hz+) ALC started operating normal again.

4- Turning up mic gain without the high pass filter just made the ALC behaving more weird since the low frequencies got serious impact on the ALC.

5- Unless TT fixed the ALC pick up point (or my observation is wrong) my quess would be that your communication grade microphone combined with your voice triggers ALC at undesired frequencies for SSB communication.

6- Perhaps it is worth to try including TX equalizer (in case TT ALC is behind TX equalizer...) and actually turning down the mic gain. Try to create the high pass filter scenario and see if the ALC now follows your voice peaks. If so, you have to find a good balance between high/low cut-off point

7- last but not least; you can also turn up the MIC audio by turning the mic potentiometer as available through a small hole at the bottom of the Orion. This will make the mix audio more sensitive. I have adjusted it to almost maximum using the TT 708 microphone.

When I find the time I will test the ALC routine combined with TX equalizer using the latest firmware (Orion 565 2064x11) using external tone generator... Generate a tone at for example 250hz, adjust volume that ALC just switched on and then include TX equalizer to see if the ALC trigger changes. That will confirm ALC frequency (in)dependency....

Hope this helps,

regards, Onno

Performed a quick test and using the latest 2064x11 firmware the ALC is -behind- the TX equalizer. Good news!

6982. Orion won't start

Yahoo group: orion565 (2009 — 2013)
Date: 2011-06-29 04:39:58 UTC
From: art davis
Topic: 6982 Message: 6982

While performing a flash upgrade on my Orion 565, there was a failure in my computer com port which stopped the process after about 10 lines had been processed. Now the radio won't boot but just sits there with the "System Loading" message displayed on the screen. It will go into Flash Update Mode, but will not communicate with the computer (different computer) through the com port. After 5 seconds or so after starting the update process, the computer displays the message "Communication with the radio has failed..." It will not perform a master reset or RAM clear.

Any suggestions short of sending it to Sevierville?

Art,
I had the same problem and if by chance your using a Windows 7 computer, others have noted it as well. Not all Windows 7 computers, just some. I solved my issue by doing a master reset and then using a Windows XP laptop with an RS232 cable. I understand Ten Tec has found the issue, and it was fixed in the new loader. If your still having trouble, I'd do the XP route the same as I did.

Last minor thought, the typical USB / RS232 cable uses a Prolific chipset. If you use the FTDI chipset instead (a buck or two more on Ebay), the converters work much better in Windows 7.

Art,

I don't know about the Orion but I messed up the loading on my Jupiter. TT sent a chip that had the current f/w and I sent back my messed up chip. Call support and see what they say. It's only a phone call away.

Thanks Gary. No, using XP here with RS-232 cable. Just one COM port on the computer, but that's enough. I'm wondering if the firmware got halfway updated, would that keep the radio from understanding the TX/RX button being held down for a master reset? That could explain why it won't do a master reset or a Ram clear or anything.

Art,
Mine was able to master reset, but it sounds like your is really stuck.
Sounds like a call to TT support to me.

I would suggest to test the serial port status... You might have a defective serial port / cable. I uploaded a test program a while back which will perform serial testing in case you don not have a serial breakoutbox. To my knowledge the upgrade procedure runs on top of a bootloader routine which provides you the upgrade screen when you switch on the rig. after that the firmware can be send to the orion and besides RX/TX aso CTS is used to ensure the firmware can be downloaded. In case the serial cable is defective (or does not have the correct wire layout) the firmware upgrade will not work. In case the max 232 chip on the logic board is busted due to ESD (non grounded rig and/or computer) you will not be able to upgrade the rig. If thats the case you need to have the max-232 chip being replaced by either sending the rig or the logic board (cheaper) to TT. Are you postive that Orion and computer where grounded to the same ground when connecting the serial cable??? In case they were not there is a high chance the max 232 chip is defect. Hope your rig gets fixed soon. Regards, Onno

Well Onno I have dug into the 565 and found a strange result. The six resistors on your rig are 2 - 33 ohm and 4 - 47 ohm.

In my rig there are:

3 - 47 ohm
2 - 33 ohm
1 - 1,000 ohm (Yes a 102)

A net total effect of about 8 ohms vs your original 6.9 ohms.

In 2009 I replaced the original black/White screen with a new version from T-T. So I removed just the pair of 33 ohm resistors and all seems well.

The display started up VERY close to where I would normally set it and stayed there. Historically it would start up very light / washed-out and take 1 or 2 minutes to get to the contrast that I normally like.

Thanks for all your efforts on this problem. I'll keep you posted with updates if anything changes.

73, Rick
VE7TK

PS: I forgot how MANY screws there are to get to the logic board - hi!!

Tony at Ten-Tec suggested replacing the battery as well. I will order one as now it is getting worse, it boots but there is no audio. On the 2nd boot it works but all the settings are scrammed so I bet it is the battery. I'm also going to check the caps on the power board to make sure they are not puffed up.

I will also exercise the display "pot" as well with the covers off since the display has been going in & out as well. When it is working the Orion is one hell of a great HF radio.

Thanks for all the good ideas and help!

From: Randy
Topic: 6993 Message: 6993

I've had a problem for sometime and think I've read about here but it's been awhile. I have to turn the power on and off two or three times to get my ORION II to work. The initial power up starts and then the audio drops out after a second or two. I remember reading about about this but cant remember what was causing this? Power supply board?

My second issue I noticed for the first time this weekend operating very heavily. 20M will die out after heavy operating. What I mean by heavy operating is operating in a contest. I can see the the ALC just stop lighting up/peaking and no output power. Are these related issues?

Thanks for any input

Any chance you have a bad connection from the power supply cable molex pins
to the Orion II? Have you tried a different power cable?

Hi Rick, Thats interesting findings indeed. I did hear various LCD versions have been out there but the value of 1000 ohm resistor in such low resistance combination makes little sense.

It could have been an error in the factory and instead of 47 ohm they inserted this weird value? Anyway, on my side the current reduction made backlight and contrast far more stable and it does not harm as far as I know.

Interested to hear your experience on the change. Do I understand correctly the start-up experience changed after the current modification? And if I may ask, did you experience pixel saturation (ghost layer) over time pre or post current reduction?

best regards, Onno

There have been some reported issues with the pins becoming loose and heating. This causes a voltage drop. Check the connections specifically looking for heating or discoloration of the pins and related housings. Some have replaced them with PowerPole connectors.

On my O1, the power up was OK but when I would transmit the rig would reboot. Eventually found it to be the cheap power connector. Pulled the back off and hardwired a powerline directly to the pc board. No more issues with the rebooting

Good luck
John

Any chance you have a bad connection from the power supply cable molex pins to the Orion II? Have you tried a different power cable?

The culprit here was the fuse socket. T-T used a badly cheap gimmick.
Replaced it with my own construction made from two FAST-ON connectors
(the smaller version) directly soldered to the PCB.

6999. Snaphat Battery replacement (Orion I - won't Boot until reset)

Yahoo group: orion565 (2009 — 2013)
Date: 2011-07-10 20:04:10 UTC
From: w5xj2011
Topic: 6974 Message: 6999

Which board is the snaphat battery located on? Is it hard to get to? Do I need the IC chip tool to take it on off? I have one from Steppir I can use. Clearly I need to replace mine and cannot seem to find a reference to this procedure for a layman to understand.

This was a good contest weekend and I worked 2 new ones!

Thanks, 73 & good DX to you!

Grant / W5XJ

--- In orion565@yahoogroups.com, "w5xj2011" <cole505@...> wrote:
>
> Tony at Ten-Tec suggested replacing the battery as well. I will order one as now it is getting worse, it boots but there is no audio. On the 2nd boot it works but all the settings are scrammed so I bet it is the battery. I'm also going to check the caps on the power board to make sure they are not puffed up.
>
> I will also exercise the display "pot" as well with the covers off since the display has been going in & out as well. When it is working the Orion is one hell of a great HF radio.

Topic: 222 Message: 7002

Well Onno after more than a week with the mod I can say that I'm VERY happy.

The display takes about 30 to 45 seconds to get up to "full" contrast at start-up. At least up to where I like it. After that it does nothing. Nothing other than stay at the correct contrast for hours!!!

After several hours the screen, pre this mod, would saturate starting at the upper left. Since the mod the screen is rock stable.

Thanks again.

73,
Rick

Topic: 6960 Message: 7003

Hello O2ers,

The latest firmware has been available for sometime now. While many users may have upgraded, I wanted to hear from some who can offer a comparison of the two latest non beta firmwares.

Perhaps some folks even prefer the earlier version over the latest. If so, I would be interested as to why.

Thank you for your input.

73,

Mike

7004. Orion 565 serial communication?

Yahoo group: orion565 (2009 — 2013)
Date: 2011-07-14 11:59:48 UTC
From: George
Topic: 7004 Message: 7004

I just bought a used Orion 565 with AT and a factory installed blue screen.

My question is, what is the make-up of the serial cable from the 565 to my computer? What is the baud rate the Orion expects.

I'm using a logging program, DX4WIN and a USB to serial cable and I can't make the 565 respond to my computer commands.

Thanks in advance.

George W2YJ

George,
the USB converter should work just fine unless your using Windows 7. If your using Windows 7, you'll need to use and FTDI type of USB to RS232 cable, not the prolific brand. Make sure in DX4WIN preferences under radio you set both DTR and TRS high or it won't work. Mine is Orion, without RIT, Com port 1, 5000 poll rate, 6 max tries, DTR adn RTS high.

I got it going by switching my MTTY serial cable with the USB-Com cable. Orion now sports the DB9 serial cable and MMTTY sports the USB to Com cable.

My baud rate was set to 57600 with DTR and RTS both checked.

Thanks to all that assisted myself.

Basically, the V2 mod simply allows the sweep to function when the Orion is
running V2 firmware.

From: pa1ap
Topic: 222 Message: 7012

Hi Rick,

Thats is excellent news and I am happy the simple modification works for you as well.

According manufacturer documentation LCD screens will always experience a cold to warm up phase since thats a natural side effect of the crystals. A thermistor could be used to automatically adjust the contrast setting but it is not easy to implement the correct voltage curve.

I have followed Fernando's (n2fq) directions replacing the power socket by two powerpoles and I was surprised to notice the difference. For the first time I can set the powersupply to 12.8Volt without the LCD screen going blank during transmission. Prior to changing power socket I had to set the DC voltage to 13.8 Volts and still have a little fading during transmission.

Anyway, I am happy 565 user again. The contrast issue never came back on my side despite leaving the rig on for days in a row and now the power socket change made it complete.

73, Onno

Hi Fernando,

Finally I arrived at my "to do job item": replacing the power connector.

It was an easy job to replace and the result was surprising. I can now run my power supply at 12.8 Volts and the unit does not fade anymore during transmission where before I had to set power supply to 13,8 Volt to -minimize- the fading effect.

Thanks again for the pictures and sharing.

73 Onno

Yes Onno the 565 is operating as it should - hi!

I also replaced the power connector with PowerPoles using Fernando's instructions. That too worked out well.

73,
Rick

7017. Snaphat Battery replaced - problem solved

Yahoo group: orion565 (2009 — 2013)
Date: 2011-07-19 04:17:42 UTC
From: w5xj2011
Topic: 7017 Message: 7017

This weekend I replaced the snap-hat battery on my 565 and it fixed the booting issues and lost memory settings. I ordered the battery from TT. My radio had been sitting powerless on the shelf for over 2 years and as a 2003 model the snap-hat expired.

I also exercised the pot that serves the contrast function of the LCD screen which seems to have cured that as well. It had been dimming off & on for some time. The pot is accessible from the underside (right side as you face the radio front)of the rig with a small screwdriver and should be exercised and then set at the 50% point.

Thanks to all the users and Paul at TT for the suggestions.

73 & good DX,

Grant / W 5 X J

The TT #2203 is the high pass filter that fixes the issue with Acom amps being tripped by the Orion on 40M and perhaps other bands. The Dunestar HPF-400 and similar filters will also get the job done. You want to reject everything below the 160M band.

Subject: [orion565] Re: Orion won't start

I would suggest to test the serial port status... You might have a defective serial port / cable. I uploaded a test program a while back which will perform serial testing in case you don not have a serial breakoutbox. To my knowledge the upgrade procedure runs on top of a bootloader routine which provides you the upgrade screen when you switch on the rig. after that the firmware can be send to the orion and besides RX/TX aso CTS is used to ensure the firmware can be downloaded. In case the serial cable is defective (or does not have the correct wire layout) the firmware upgrade will not work. In case the max 232 chip on the logic board is busted due to ESD (non grounded rig and/or computer) you will not be able to upgrade the rig. If thats the case you need to have the max-232 chip being replaced by either sending the rig or the logic board (cheaper) to TT. Are you postive that Orion and computer where grounded to the same ground when connecting the serial cable??? In case they were not there is a high chance the max 232 chip is defect. Hope your rig gets fixed soon. Regards, Onno

> While performing a flash upgrade on my Orion 565, there was a failure in my computer com port which stopped the process after about 10 lines had been processed. Now the radio won't boot but just sits there with the "System Loading" message displayed on the screen. It will go into Flash Update Mode, but will not communicate with the computer (different computer) through the com port. After 5 seconds or so after starting the update process, the computer displays the message "Communication with the radio has failed..." It will not perform a master reset or RAM clear.

7023. Orioin 565 and the Elecraft P3 Panadapter?

Yahoo group: orion565 (2009 — 2013)
Date: 2011-07-29 04:51:05 UTC
From: Eric Rosenberg
Topic: 7023 Message: 7023

Has anyone put these two together?

The P3 is awfully neat - I've played with one at a friend's.

The one drawback I see is that it doesn't read the Orion frequency, so it's a bit clunky to figure out what you're seeing.

I understand that it may be possible to get that (frequency) information from the Orion to the P3. Has anyone done it?

Thanks & 73,

Eric W3DQ

I believe I have a problem in the 1st IF section of my 565 Orion I.

After a big lightning storm passed through the area I noticed a slight reduction in sensitivity. I use a LP-Pan on the rig, and noticed the signal level, and noise floor have dropped about 10 dBm.

I have gotten the schematics from the TT site, but I can not print a quality, readable schematic for the IF Board. My print out is all "scrunched up."

Does any one have a good printable schematic I could use?

Thanks for the assistance.

Why don't you just enlarge (zoom in) sections of the PDF schematic on your computer monitor and use a screen capture utility and print the screen captures?

7027. Re: Orioin 565 and the Elecraft P3 Panadapter?

I owned a P3 that I used with a K3 before I acquired my Orion II. It's a very capable panadaptor with excellent resolution. I no longer have the K3/P3 and never attempted to use the P3 with the Orion. I recall that the RS232 cable from the PC connects to the P3 first and then the K3, but I don't know if the P3 is capable of accepting a "set frequency" type of command.

I use the DXLab suite for logging and its CAT interface module, Commander, includes function to allow you to slave the frequency of two rigs together. At one time, I had it set up so that if I tuned either my FT-1000MP Mk V or my Icom Pro III, the other rig would follow the frequency change. That capability also works for the Orion, so if the P3 can act on K3 frequency set commands, that would be one approach to use.

You'd still have a problem with the IF offsets being correctly reflected for the Orion. Not sure there's an easy way to accomplish that. If the offset is wrong, the signal on the panadaptor would not be properly positioned in relation to the signal you're hearing.

Cannot determine if this was sent to me. In any event, my call sign is NA6D. I have been a ham for 51 years. If there is a problem, I will be happy to scan my license and send it to you. Please let me know if there is any additional information you need. Have a good weekend!

Maybe we've been hacked! Hope not. Don't think they would have info they would understand. Do we want to report this to Yahoo as a security breach?
